NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packer leakage test shall be commenced on each multiply completed well within seven days after actual completion of the well, and arranally thereafter as prescribed by the order authorising the multiple completion. Such tests shall be commenced on all multiple completions within seven days following repletion and/or chemical or fracture treatment, and whenever remedial work has been done on a well during which the packer or the tubing have been disturbed. Tests shall also be taken at any time that unication is suspected or when requested by the Divisio
- 2. At least 72 hours prior to the commencement of any packer test, the operator shall notify the Division in switting of he exact time the test is to be commenced. Offset operators shall also be notified.
- Packer leakage tests shall commence when both sones of the dual completion are shut-in for pressure stabilization. Both sones shall remain shut-in until the well-head pressure in each has stabilized, provided however, that they need not remain shut-in more than seven days
- 4. For Flow Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other sone remains shut-in. Such test shull be continued for seven days in the case of a gas well and for 24 hours in the case of an of well. Note: if, on an initial packer leakage test, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- \$. Following completion of flow Test No. 1, the well shall again be shut-in, in accordance with Paragraph 3

- 8. Flow Test No. 2 shall be conducted even though no leak was indicated during Flow Test No. 1. Proceed for Flow Test No. 2 is to be the same as for Flow Test No. 1 except that the previously produced some shall remain shut-in while the some which was previously shut-in produced.
- 7. Pressure for gas-sone tests must be measured on each sone with a deadweight pressure gauge at time intervals as follows: 3 hours test: immediately prior to the beginning of each flow-period, at fifteen minute intervals charing the first hour thereof, and at hourly intervals thereafter, including one pressure. measurement immediately prior to the conclusion of each flow period. 7-day tests: immediately prior to the beginning of each flow period, at least one time during each flo w period iat approximately the w and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test data.

24-hour of some tests; all pressures, throughout the entire test, shall be continuously measured and errients we stark state, as pressures, unsugnout the enter test, shall be commissionly measured and recorded with recording pressure gauges the accuracy of which must be checked at least test, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is gas off or a off gas dual completion, the recording gauge shall be required on the off zone only, with deadweight pressures as required above being taken on the gas zone.

ed tests shall be filed in triplicate within 15 days after the e the test. Tests shall be filed with the Aster District Office of the New Mexico Off Conservation Division on Northwest New Mexico Packer Leakage Test Form Revised 10-01-78 with all deadweight pressure indicated thereon as well as the flowing temperatures (gas zones only) and gravity and GOR (all zones only).
