NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

Date

Title Field Tester

11-30-95

1. A packer leakage test shall be commenced on each multiply completed well within seven days after actual 1. A person measure used around or consideration on each monthly completion of the well, and arrivally thereafter an prescribed by the order authorising the multiple completion. Such tests shall be commenced on all multiple completions within seven days following. recompletion and/or chemical or fracture treatment, and whenever remedial work has been done on a well during which the packer or the tubing have been disturbed. Tests shall also be taken at any time that nunication is suspected or when requested by the Divis

Upper Completion

- At least 72 hours prior to the commencement of any packer test, the operator shall notify the Division in writing of he exact time the test is to be commenced. Offset operators shall also be notified.
- Packer leakage tests shall commence when both somes of the dual completion are shut-in for pressure stabilization. Both zones shall remain shut-in until the well-head pressure in each has stabilized, provided however, that they need not remain shut in more than seven days.
- 4. For Flow Test No. 1, one some of the dual completion shall be produced at the normal rate of production while the other some remains shut-in. Such test shall be continued for seven days in the case of a gas well and for 34 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- ring completion of flow Test No. 1, the well shall again be shut-in, in accordance with Paragraph 3

- 6. Flow Test No. 2 shall be conducted even though no leak was indicated during Flow Test No. 1. Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1 except that the previously produced some shall remain shut in while the sone which was previously shut in produced.
- Pressure for gas-zone tests must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours test: immediately prior to the beginning of each flow-period, at fifteen minute intervals during the first hour thresh, and at hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each fies period. 7-day testa: immediately prior to the beginning of each flow period, at least one time during each for w period (at approximately the unidway point) organisms on containing persons in many was used using each more person ast approximately the user-way person and immediately prior to the conclusion of each flow person. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test data.

24-hour oil some testa; all presources, throughout the entire test, shall be continue recorded with recording pressure gauges the socuracy of which must be checked at least twice, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is gas-oil or a oil-gas dual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gas some.

The results of the above described tests shall be filled in triplicate within 15 days after the completion of the test. Tests shall be filed with the Aster District Office of the New Mexico Off Conservation Division on Northwest New Mexico Packer Leakage Test Form Revised 10-01-78 with all deadweight pressure indicated thereon as well as the flowing temperatures igas mores only) and gravity and GOR ind somes only).
