NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packer lenkage test shall be commenced on each multiply completed well within seven days after actual completion of the well, and annually theresives as prescribed by the order authorizing the multiple completion. Such tests shall be commenced on all multiple completions within seven days following recompletions and/or chemical or fracture transment, and whenever remedial work has been done on a well during which the packer or the nabing have been disturbed. Tests shall also be taken at any time that communication is asspected or when requested by the Division.
- At less 72 hours prior to the commencement of any packer sext, the operator shall notify the Division in writing of he exact ne the text is to be commenced. Offset operators shall also be notified.
- Packer leakage terms shall commence when both zones of the deal completion are shut-in for pressure stabilization. Both
 zones shall remain shut-in until the well-head pressure in each has stabilized, provided however, that they need not remain shutin more than seven days.
- 4. For Flow Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shur-in. Such text shall be continued for zeven days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- 5. Following completion of flow Test No. 1, the well shall again be short in, in accordance with Paragraph 3 above

- 6. Flow Tex No. 2 shall be conducted even chough no leak was indicated during Flow Text No. 1. Procedure for Flow Text No. 2 is to be the same as for Flow Text No. 1 except that the previously produced some shall remain shar-in while the zone which was previously shar-in produced.
- 7. Pressure for gas-none texts must be measured on each some wich a deadweight pressure gauge at time innervals as follows: 3 hours text: immediately prior to the beginning of each flow-period, at fifteen minute intervals during the first hour thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period, at least one time during each flow period for approximately the midway point; and immediately prior to the text provides of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previoudly shown questionable text data.

 34-hour oil some texts, all pressures, throughout the entire text, full be continuously measured and recorded with seconding pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of each text, with a deadweight pressure gauge. If a well is gas-oil or a oil-gas dual completion, the recording gauge shall be required on the all some only, with deadweight pressures as required above being taken on the gas none.
- 8. The results of the above described tests shall be filed in triplicate within 15 days after the completion of the test. Tests shall be filed with the Assec District Office of the New Mexico Oil Conservation Division on Northwest New Mexico Packer Leskage Test Form Revised 10:01-78 with all deadweight pressure indicated thereon as well as the flowing temperatures (gas mones only) and gravity and GOR (oil zones only).
