Attn: Mr. John Hastings, Production Engineer

Re: Completion Status, Sunray's
Navajo Table Mesa #1
N-27-28N-17W

Dear Mr. Hastings:

On September 4, 1965 a 30-day allowable for 2835 barrels or 105 barrels per day was granted the above well. We restricted the allowable to a 30-day period for the reason that this well appears from our information to be open in both the Paradox C and D zones. As the Paradox C zone is producing Hellum Gas in several Continental wells nearby we were reluctant to approve the completion of this well without further information regarding the producing zones.

At the time we granted the well's allowable we discussed the matter with USGS personnel in Farmington and they informed us that they understood it was your intention to produce the well about 30 days and then re-enter the hole and continue drilling to test the Mississippian Formation. They informed us that they understood that you would at that time install and cement casing across the Paradox pay zones in order that a selective completion might be accomplished.

On October 7, 1965 a Gas-Oil Ratio test was received on the well but as there was no submittal letter with the test we were unable to determine whether you expected further allowables to be issued or whether the test was merely submitted for information purposes. We have no objection to production of the well in its present condition for a limited period of time if you wish to test further for information purposes. However we do not believe that a final approval of your completion can be made without further information from you concerning the completion interval.
