## NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packer leakage test shall be commenced on each multiply completed well within seven days after \_\_except that the previously produced zone shall remain shut in while the zone actual completion of the well, and arrandly thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be connected on all multiple completions within seven days following recompletion and/or themical or fracture treatment, and whenever remedial work has been dorie on a well during which the packer or the tubing have been disturbed. Tests shall also be taken at any time that communication is suspected or when requested by the Division.
- 2) At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so
- 3. The pacing leakage test shall redumence when both zones of the dual completion are sinu-in for pressure stabilization, both zones shall remain star in until the well-head pressure in each bas stabilized, provided however, that they need not remain shut-in more than seven days.
- 4. For flow Test No. 1, och zode of the distrocompletion shall be produced at the normal rate of production while the other zone primaring sharin. Such test shall be continued for seven days if the case of a year well and for 24 hours in the case of an oil well. Note: if, no an initial parter leakage test, a gas well is being flowed to the suncephere due to the lack of a pipeline connection the flow period shall
- 5, Following completion of flow Test No. 1, the well shall again be shabin, in accordance with
- Photograph 3 above.

  (16) Flow Test No. 2 shall be constipled given though to Sait was endicated during flow Test No. 1:

  Proportion for Flow Test No. 2 is to be the same as fee Flow Test No. 1.

- was previously shat-in is produced.
- 7. Pressures for gas-zone tests must be measured on each zone with a de pressure gauge at time inservals as follows: 3 hours tests: immediately prior to the beginning of each flow-period, at fifteen minute intervals during the first hour thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the donclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test data.
- 24-hour oil zone tests: all pressures, throughout the entire test, shall be consimiously measured and recorded with recording pressure gauges the accuracy of which must be checined at least ravior, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the saz zone.
- 8. The results of the above described tests shall be filed in triplicate within 15 days after completing of the test. Tests shall be filed with the Artice District Office of the New Mexico, Oil Conservation Division of Northwest New Mexico Packer.

  Leaking Test form: Revised (00) 785 with all deady-light presidents indicated. thereon as well as the llowing semperatures (gas short dolly and afairty and GOR) (oil squal poly).
