## NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- A packer leakage sear shall be commenced on each multiply completed well wishin seven days after across completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fracture resument, and whenever remedial work has been done on a well during which the packet or the rubing have been disturbed. Tests shall also be taken at any time that communication is suspected or when requested by the Division.
- At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so satisfied.
- The packer leakage test shall commence when both zones of the dual completion are shar-in for previous subdistation. Both zones shall remain shut-in until the well-head pressure in each has stabilised, provided however, that they need not remain shut-in more than seven doys.
- 4. For Flow Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shat-in. Such test shall be continued for zeven days in the case of a gas well and for 14 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- Following completion of Flow Test No. 1, the well shall again be short-in, in accordance with Puragraph 3 shore.
- 6. How Ten'No. 2 shall be conducted even though no leak was indicated during Flow Test No. 1. Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1 except

- that the previously produced some shall remain aboss in while the some which was previously aborter is produced.
- 7. Pressures for gas-some tests must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours nexts: immediately prior to the beginning of each flow-period, at fafteen-minute intervals during the first hour thereof, and a hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day seems immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midwa point) and immediately prior to the conclusion of each flow period. Other pressures make taken as desired, at may be requested on wells which have previously shown questionable test data.

24-hour oil some text: all pressures, throughout the entire text, shall be continuous: measured and recorded with recording pressure gauges the accuracy of which must be checked at least rwice, once at the beginning and ower at the end of each seat, with deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil some only, with deadweight pressures as require above being taken on the gas some.

8. The results of the above-described tests shall be filled in triplicate within 15 days aft completion of the test. Tests shall be filled with the Asset Duttes Office of the New Method Conservation Division on Northwest New Mexico Packer Leakage Test Form Reviol 10-01-78 with all deadweight pressures indicated thereon as well as the flows temperatures (gas some only) and gravity and GOR (oil somes only).
