- 1. A packer leakage test shall be commenced on each multiply completed well within seven days after acrual completion of the well, and annually their after as prescribed by the order authorizing the multiple completion. Such terts shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fracrure treatment, and whenever remedial work has been done on a well during which the packer or the tubing have been disturbed. Tests shall also be taken at any time that communication is suspected or when requested by the Division.
- At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- The packer leakage ten shall commence when both zones of the dual completion are shut in for pressure trabilization. Both zones shall remain thut in until the well-head pressure in each has stabilited, provided however, that they need not remain short-in more than seven days.
- 4. For Flow Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shut-in. Such test shall be continued for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- 3. Following completion of Flow Test No. 1, the well shall again be shut-in, in accordance with Paragraph 3 above.
- 6. Flow Test'No. 2 shall be conducted even though no leak was indicated during Flow Test No. 1. Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1 except

reviously produced 2000 shall remain shur-in while the 2000 which was previousis produced.

tes for gas-2000 term must be measured on each 2000 with a deadweight tuge at time intervals as follows: 3 hours tests: immediately prior to the beginnflow-period, at fifteen-minute intervals during the first hour thereof, and at reals thereafter, including one pressure measurement immediately prior to the of each flow period. 7-day tests: immediately prior to the beginning of each at least one time during each flow period (at approximately the midway immediately prior to the coochision of each flow period. Other pressures may s desired, or may be requested on wells which have previously shown queset data.

pt oil zone tesu: all pressures, throughout the entire test, shall be continuously and recorded with recording pressure gauges the accuracy of which must be least twice, once at the beginning and once at the end of each test, with a pressure gauge. If a well is a gas oil or an oil-gas dual completion, the recordshall be required on the oil 2000 only, with deadweight pressures as required g taken on the gas zone.

pults of the above-described tests shall be filed in triplicate within 15 days after of the test. Tests shall be filed with the Aztec District Office of the New Mexico ration Division on Northwest New Mexico Packer Leakage Test Form Revised ith all deadweight pressures indicated thereon as well as the flowing (gu 2000s only) and gravity and GOR (oil 2000s only).
