## NORTHWEST NEW MEDICO PACKER LEAKAGE TEST INSTRUCTIONS

- A packer leakage next shall be commenced on such multiply completed well within zeron days after across completion of the well, and amoustly thereafter as prescribed by the order authorizing the multiple completion. Such term shall also be commenced on all multiple completions within seven days following recompletions and/or chemical or fracture treatment, and whenever remedial work has been done on a well during which the packer or the rubing have been distraited. Term shall also be taken at any time that communication is suspected or when requested by the Division.
- At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- The packer leakage ten shall commence when both zones of the dual completion are shart in for previous nabilization. Both zones shall remain shart-in anuli the well-head pressure in each has nabilized, provided however, that they need not remain short-in more than seven does.
- 4. For Flow Tert No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains short-in. Such user shall be continued for seven days in the case of a gas well and for 24 hours in the case of an oil well. Nose: if, on an initial packer leakage test, a gas well is being flowed to the aemosphere due to the lack of a pipeline connection the flow period shall be three boors.
- 3. Tollowing completion of Flow Test No. 1, the well shall again be shot-in, in accordance with Paragraph 3 share.
- 6. Flow Text'No. 2 shall be conducted even though no leak was indicated during Flow Text No. 1. Procedure for Flow Text No. 2 is so be the mean as for Flow Text No. 1 energy

- that the previously produced some shall remain shan as while the some which was priviously short-in a produced.
- 7. Pressures for gas-zone tests must be measured on each zone with a dendweigl pressure gauge at time intervals as follows: 3 hours area: immediately prior to the begins ing of each flow-period, at fifteen-minute intervals during the first hour thereof, and hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period, 7-day tests: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midw point) and immediately prior to the conclusion of each flow period. Other pressures as bettern as desired, or may be requested on wells which have previously shown que tionable test data.

14-hour oil some text: all presences, throughout the entire text, shall be maximous measured and recorded with recording pressure gauges the accuracy of which atom checked at least rovice, once at the beginning and once at the end of each sext, with deadweight pressure gauge. If a well is a gaz-oil or an oil-gas dual completion, the rocoi ing gauge shall be required on the oil some only; with deadweight pressures as require above being taken on the gas some.

8. The results of the above-described tests shall be filed in triplicate within 15 days at completion of the test. Tests shall be filed with the Astee Duturs Office of the New & Oil Conservation Division on Northwest New Mexico Packet Leakage Test Form & 10-01-78 with all deadweight pressures ordinated thereon as well as the temperatures (gas soons only) and gravity and GOR (oil soons only).
