RE: Request for Administrative  
Approval to Downhole Commingle  
Robert L. Bayless  
Jicarilla 519 #1  
Unit 0, Sec. 18, T30N-R2W  
Undesignated Gallup and  
Undesignated Pictured Cliffs Fields  
Jicarilla Contract #519  
Rio Arriba County, New Mexico

Dear Mr. Lemay:

By this letter, we request administrative approval to commingle production from the Gallup and Pictured Cliffs formations within the wellbore of the above captioned well.

The Jicarilla 519 #1 well was drilled by Amoco Production Company in November and December of 1985. A complete daily activity report for this well is presented as Attachment #1. Production casing, (5-1/2") was set and cemented at the total depth of the well, 8703 feet. The Dakota interval, (8578-8597 ft.) was tested and abandoned by setting a cast iron bridge plug at 8150 feet and capping it with 2 sacks of cement. This is the current PBTD for this well. The Gallup interval (7280-7704 ft.) was perforated and fracture stimulated with 254,730 gallons of 30# crosslinked gelled fluid containing 400,000 lbs. of 20-40 sand. Amoco determined this well to be uneconomical and turned operations of this well over to Robert L. Bayless.

Bayless ran a 3 hour flow test for the Gallup formation on May 28, 1987, which resulted in an AOF of 1032 MCFGPD (Attachment #2). A retrievable bridge plug was set at 4000 feet, and the Pictured Cliffs formation was perforated from 3723 to 3728 feet. The Pictured Cliffs formation was then fracture stimulated with 16,5000 gallons of 70 quality foam containing 20,000 lbs. of sand. A 3 hour flow test was conducted on the Pictured Cliffs formation on June 15, 1987, which resulted in an AOF of 762 MCFGPD (Attachment #3). In addition to the AOF tests performed on each zone by Bayless, a 12 day flow test was performed on the Gallup formation by Amoco in June of 1986, and Bayless performed an 8 day flow test on the Pictured Cliffs formation in June of 1987. The Gallup zone averaged 149 MCFGPD with 18 BWPD, while the Pictured Cliffs zone averaged 75 MCFGPD with 3 BWPD. Both tests were run against 50-60 psi backpressure. These tests are presented as Attachments #4 and #5.

William J. Lemay, Chairman  
Page 2  
July, 1987

The flow test results from each zone indicate that each zone has marginal gas production capabilities and some associated water production. These tested flow rates are performed against 50-60 psi backpressure, while line pressures in the area can get as high as 450-500 psi. The actual gas sales production rates from each zone will be even lower against this higher backpressure, with the possibility of the backpressure stopping flow from the zone, which would result in compression expenses to re-establish the flow. The water production seen from each zone could also restrict gas production from each zone, or possibly log off the flow from the zone. This would necessitate artificially lifting this fluid, resulting in further expenditures. If commingling is granted in this wellbore, the combined zones would have a better chance of production against higher line pressures without compression and would be better able to lift the fluid in these zones without artificial lift. The gas produced from the Gallup and Pictured Cliffs formations is very similar in this area. The average gas gravity for the Pictured Cliff zone in this area is .653 with an average BTU value of 1131, while the average gas gravity for the Gallup interval is .628, with an average BTU of 1072. The gas gravities used for each zone were taken from the closest offsetting wells having this data available. A summary of this data is presented in Attachment #6. The small difference in these values indicate that the gas produced from both zones is very similar and should not cause any damage should crossflow occur between zones.

From the AOF tests discussed earlier, the 1065 psi surface shutin pressure taken on the Pictured Cliff zone corresponds to a calculated bottomhole pressure of 1178 psi at 3725 ft.(mid perf of the P.C. zone). The 2957 psi surface shutin pressure taken on the Gallup zone corresponds to a calculated bottomhole pressure of 3600 psi at 7492 ft.(mid perf of the Gallup interval). Even though the Pictured Cliffs bottomhole pressure is less than 50% of the Gallup bottomhole pressure, the gas from both zones is very similar, and any crossflow occurring between zones will cause no damage to the formation.

The production from the Pictured Cliffs and Gallup zones could be allocated using the ratios of the rate of flow calculated during the AOF tests performed by Bayless. Using these tests, 57% of the commingled gas production should be allocated to the Gallup formation and 43% of the gas should be allocated to the Pictured Cliffs formation. This allocation formula is shown in Attachment #7. The value of the gas from each zone is approximately the same, so the commingling of this natural gas will not decrease its sales value.

Attachment #8 is an acreage plot showing the ownership of leases in the vicinity of the Jicarilla 519 #1 well. The ownership (working interest, royalty, and overriding royalty) of both the Pictured Cliffs and Gallup formations is common in this well. The operation of each of the leases

William J. Lemay, Chairman  
Page 3  
July 2, 1987

around this well is controlled by or will be controlled by Robert L. Bayless through farmout agreements. At this time, Union Oil Company of California controls Jicarilla Contract #516. They have been notified of this commingling application by certified mail. A copy of this letter is enclosed as Attachment #9. By copy of this application, we have also advised the BLM of our plans to downhole commingle the Gallup and Pictured Cliffs formation in this well.

It is obvious from the production tests taken on the Pictured Cliffs and Gallup zones that gas production from this well will be low, resulting in marginal gas reserves and economics for the well. The high pipeline pressures in the area could force Bayless to compress this gas to produce it, or the water produced from each zone could force more expenditures to artificially lift this produced fluid. Either or both of these expenditures could possibly be avoided by approval of downhole commingling in this well.

Sincerely,

Kevin H. McCord  
Petroleum Engineer

ROBERT L. BAYLESS

PETROLEUM PLAZA BUILDING  
P. O. BOX 168  
FARMINGTON, NEW MEXICO 87499  
(505) 326-2659

JICARILLA 519 #1  
SE/4, Sec. 18, T30N-R2W  
Rio Arriba County, New Mexico  
RE-COMPLETION REPORT

- 5-29-87 Move in and rig up Bayless Rig 4. Shut down for the night.
- 5-30-87 Shut down - Saturday
- 5-31-87 Shut Down - Sunday
- 6-01-87 Lay down 242 jts. of 2-7/8" EUE tubing on float. Sent float to Amoco yard. Rigged up Basin Perforators - set wireline, set retrievable bridge plug at 4000 ft. RKB. Pressure tested bridge plug to 3000 psi - held ok for 5 minutes. Dropped 10 gallons of sand on top of bridge plug. Shut down for night.
- 6-02-87 Rigged up Basin Perforators. Ran GR-CLL-CBL from 3991 ft. to 3000 ft. under 1,000 psi pressure. Top of cement at 3311 ft. RKB. Pictured Cliffs interval and Fruitland interval had good bond, but poor bond below and above. Pictured Cliffs perforations have no bond below and 47 feet of bond above. Perforated Pictured Cliffs interval with 4" casing gun and 4 JSPP as follows:
- 3723 - 3728'    5'    20 holes (.50" diameter)
- Lost perforating gun and 500 ft. of wireline when coming out of hole with gun run (line parted). Trip in hole with grapple type spear on tubing, recovered fish first try. Lay down wireline and perforating gun. Shut down for night.
- 6-03-87 Trip in hole with 4-1/2" X 2-3/8" swage on end of tubing. Rigged up The Western Company. Circulate hole clean with 2% KCL water, move tubing to 3423'. Broke down Pictured Cliffs perforations at 3300 psi. Established an injection rate into perforations down the tubing of 4.0 BPM @ 2200 psi. ISIP - 350 psi. Re-established an injection rate into perforations down the tubing of 4.0 BPM @ 2200 psi. ISIP = 350 psi. Acidized down the tubing with 250 gallons of 7-1/2% DI weighted HCL acid containing 30 l.1 sg RCN ball sealers. 4.0 BPM @ 2200 psi, had good ball action. Balled off to 3500 psi. Bled off pressure. Final injection rate of 4.0 BPM @ 1300 psi. ISIP = 350 psi. Moved tubing with swage below perforations to knock off ball sealers. Trip tubing out of hole. Fracture stimulated the Pictured Cliffs interval with 16,500 gallons of 70 quality foam containing 20,000 lbs. of 20/40 sand as follows:

4000 gallons of pad	30 BPM @ 1600 psi
5000 gallons of 1 ppg 20-40 sand	30 BPM @ 1900-2100 psi
7500 gallons of 2 ppg 20-40 sand	30 BPM @ 2100-1800 psi
3627 gallons of flush	30 BPM @ 1800 psi

ISIP = 1500 psi, 5 min = 1300 psi, 10 min = 1300 psi, 15 min = 1300 psi. (All water contained 2% KCL and 1/2 gal/1000 clay stabilization agent.) Average rate - 30 BPM; Average pressure - 1900 psi; Maximum pressure - 2200 psi; Minimum pressure - 1600 psi. Average Nitrogen injection rate - 18,000 SCF/min, total Nitrogen pumped 272,395 SCF, total fluid to recover - 162 bbls. Shut in well for 3 hours. Opened well to atmosphere through 1/2" bull plug. Shut down for night.

6-04-87 Well flowing to cleanup after frac.  
 9:00 AM - 1/2" opening flowing pressure = 140 psi - no sand, gas won't burn.  
 5:00 PM - 1/2" opening flowing pressure = 140 psi - no sand, gas burns.

6-05-87 Well flowing - 7:30 AM - 1/2" opening flowing pressure = 50 psi - gas burns. Approximate flow rate = 337 MCFGPD. Kill well, trip in hole with 2-3/8" tubing. Tag sand fill at 3958 ft. RKB. Landed Tubing as follows:

DESCRIPTION	LENGTH	DEPTH
KB to landing point	10.60	0-11
121 jts., 2-3/8", 4.7#/ft, J-55 and N-80 used tubing	3696.34	11-3707
1 - seating nipple	1.00	3707-3708
1 jt., 2-3/8", 4.7#/ft., N-80 used tubing	31.63	3708-3739
	3739.57	

Nipple down BOP - nipple up wellhead. Released rig.

6-06-87 Well shutin - Building pressure for AOF test.  
 6-07-87 Well shutin - Building pressure for AOF test.

RE: Proposed Downhole Commingling  
Jicarilla 519 #1 Well  
Unit 0, Sec. 18 T30N R2W  
Rio Arriba County, New Mexico

Gentlemen:

The Jicarilla 519 #1 well is an offset well to your JICARILLA CONTRACT #516. We plan to downhole commingle the Gallup and Pictured Cliffs formation in this well and have requested the New Mexico Oil Conservation Division to administratively approve this commingling of production. A copy of this application is attached.

In order to obtain approval from the Oil Conservation Division Director, we must obtain waivers of objections from offset lease holders. If you have no objections to our plans, please execute the waiver portion of this letter and return one copy to us at the above address and another copy to the Division Director, Oil Conservation Division, P.O. Box 2088, Santa Fe, NM 87501.

If you require additional information, please advise.

Yours truly,

**Original Signed By**  
**ROBERT L. BAYLESS**  
Robert L. Bayless

RLB:blk

Enclosure:

I have no objection to the above stated plans.
