# Sims Mesa CDP Modification

NEBU #423R

Modifications made by Devon Energy at the Sims Mesa CDP include enlargement of piping, installation of larger separation vessels, enlargement of metering facilities, and the installation of slug catchers to facilitate pigging operations in the field. The objective of the modifications was to bring down line and wellhead pressures, which in turn allows the coal formation to give up more gas, increasing production. The new facilities were gradually brought on line and tested, and the entire system was allowed to stabilize at the new lowered pressures. All components of the new CDP were stabilized and operational by 12/11/98. After the #423R operated at the lowered pressures for about 3 1/2 months, the well experienced problems with water loading. A pumping unit has subsequently been installed to remove the water off of the coal formation, allowing production to return to previous higher rates.
