NORTHWEST NEWMEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- I. A packer leakage, est shall be commenced on each multiply completed well within seven days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests stall also be commenced on all multiple completions within seven days following, recompletion and or chemical or fracture treatment, and whenever remedial work has been done on a well during which the packer or the tubing navel need disturbed. Tests shall also be taken at any time that communication is suspected or when requested by the Division.
- 2. At least 72 hours prior to the commencement of any packer leakage test, the operator shall not fy the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- 3. The packet leakage test shall commerce when both zones of the dual completion are shart in for pressure stabilization. Both zones shall remain shut-in anti-the well-head pressure to each has stabilized, provided however, that they need not remain shut-in more than seven thas.
- 4. For how, est No. 1, one zone of the dual completion shall be produced at the normal rate of produce by while the other zone remains souther. Such test shall be continued for sever days in the case of a gas well and for 24 hours in the case of an oil well. Note lift on an initial packer leakage test, a gas well as being flowed to the atmosphere due to lack of a pipeline connection the flow period shall be three hours.
- 5 Following completion of Flow Test No. 1, the well-shall again be shut-in. in accordance with Paragraph 3 above.
- 6 Flow Test No. 2 shall be conducted even though no leak was indicated during Flow Test No. 1. Procedure for Farw Test No. 2 is to be the same as for Flow Test No. 1 except

- that the previously produced zone shad remain shut-in while the zone which was records visibut-in is preduced.
- Pressures for gas-zone tests must be measured on each zone with a deadweight bossure gauge at time intervals as follows. 3 hours tests immediately prior to the programing of each flow period, at three-minute intervals during the first hour thereor, and at broady intervals thereafter, including one pressure measurement immediately prior to the correlation of each flow period. They provide the midway point and immediately prior to the correlation of each flow period, at east one time during each flow period, and approximately the midway point and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test data.
- 24-hour oil zone tests, all pressures, throughout the entire test, shall be commously measured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an on-gas dual completion, the recording gauge shall be recuired on the oil zone only, with deadweight pressures as required above being taken on the gas zone.
- 8. The results of the above-described tests shall be filed in trip, date within 15 days after completion of the test. Tests shall be filed with the Aztec District Office of the New Mexico Oil Conservation Division on Northwest New Mexico Poscer Leakage First Form Revised 16-01-78 with all deadweight pressures incidated thereon as well as the flowing temperatures (43) zones only and gravity and GOR (c. 2003) only.
