DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

We propose to drill to test the Dakota Sandstone formation at approximately 1600'. We will set 100' of 8-5/8" surface pipe and circulate cement to surface, (about 50 sacks). We will drill 7-7/8" hole. In case of possible production in Dakota, 5-1/2" casing will be set through and cemented with between 100 and 125 sacks. Pipe would then be perforated for completion attempt.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may commence.
