The elevation of the derrick floor above sea level is 5691 ft.

DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

This well was completed in December of 1959 for a potential of 209 MCF of gas per day. Although this well has not produced since completion, recent tests indicate that the completion reservoir has depleted to a point where this well would be uneconomical to produce. Since there are no other known prospective intervals for obtaining commercial production in this well, we propose to plug and abandon as follows: Mud up and spot 15 sack cement plug across perforations from 1730' to 1748' and 10 sack cement plug in top of casing. Well head will be removed and a 4" pipe marker will be cemented in top of hole.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
