NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

Date

1. A packer leakage rest shall be commenced on each multiply completed well within seven days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such term shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fracture treatment, and "perfect remedial work has been done on a well during which the packet or the rubing place been distributed. Term shall also be taken at any time that communication is suspected or when requested by the Division.

Original Signed by CHARLES GHOLSON

DEPUTY OIL & GAS INSPECTOR, DIST. #3

Title

et floor, deset # *

- At least 12 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall aim - to notified.
- 3. The packer least that commence when both zones of the dual completion are shut-in for pressure as offersion. Both zones shall remain shut-in until the well-head pressure in each has stabilized, provided however, that they need not remain shut-in more than seven days.
- 4. For Flow Ten No. 1, one rone of the dual completion shall be produced at the normal rate of production while the other rone crassins sharein. Such test shall be continued for seven days in the case of a gas well and a 24 hours in the case of an oil well. Note: if, on an initial packer leakage tent, a gas well a beginning flowed to the asmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- Following completion of Flow Test No. ... he well shall again be short-in, in accordance with Paragraph 3 above.
- Flow Ten'No. 2 shall be conducted even though no leak was indicated during Flow Test No. 1. Procedure for Flow Test No. 2 is so be the same as for Flow Test No. 1 except

- that the previously produced zone shall remain abus-in while the zone which was previous ly abus-in is produced.
- 7. Pressures for gas-some term must be measured on each some with a deadweight pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the beginning of each flow-period, at fifteen-minute intervals during the first hour thereof, and at hously intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day tests: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway pount) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test data.

24-hour oil sone tests: all pressures, throughout the entire sest, shall be continuously measured and recorded with recording pressure gauges the security of which must be checked at least roice, once at the beginning and once at the end of each stat, with a dendweight pressure gauge. If a well is a gas-oil or an oil-gas deal completion, the recording gauge shall be required on the oil sone only; with dendweight pressures as required above being taken on the gas sone.

8. The results of the above-described tests shall be filed in triplicate within 17 days after completion of the test. Tests shall be filed with the Asset Dutters Office of the New Mexico Oil Conservation Division on Northwest New Mexico Fachat Leshage Test Form Revised 10-01-78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas 2000s only) and gravity and GOR (oil 2000s only).
