NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- A packer leakage seat shall be commenced on each multiply completed well within seven days after across completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be consistenced on all multiple completions within seven days following recompletion and/or chemical or fracture treatment, and whenever remedial work has been done on a well during which the packet or the rubing have been distracted. Term shall also be taken at any time that communication is suspected of when requested by the Division.
- At least 72 hours prior to the commencement of any packer leakage test, the operator shall nonly the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- 3. The packer leakage test shall commence when both rones of the dual completion are shuri-in for pressure stabilization. Both zones shall remain shuri-in until the well-head pressure in each loss stabilized, provided however, that they need not remain shuri-in more than green days.
- 4. For Flow Tex No. 1, one some of the dual completion shall be produced at the normal rate of production while the other some remains short-in. Such text shall be continued for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage text, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- Following completion of Flow Test No. 1, the well shall again be short-in, in accordance with Paragraph 3 above.
- 6. Flow Ten'No. 2 shall be conducted even though no leak was indicated during Flow Test No. 1. Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1 except

- that the previously produced some shall remain shot-in while the some which was previously shot-in is produced.
- 7. Pressures for gas-some resu must be measured on each some with a deadweight pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the beginning of each flow-period, at fifteen-minute intervals during the first hour thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day tests: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the divar point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test data.

14-hour oil some text:: all pressures, throughout the entire text, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, must at the beginning and once at the end of each text, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil some only, with deadweight pressures as required above being taken on the gas some.

8. The results of the above-described sexts shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Aster Dustret Office of the New Mexico Oil Conservation Division on Northwest New Mexico Packet Leakage Test Form Review 10-01-78 with all deadweight pressures ordicated thereon as well as the flor temperatures (gas 2000s only) and gravity and GOR (oil 2000s only).
