NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packer leakage and shall be commenced on each auditiply completed with within seven days after actual completion of the well, and assumily thereafter as prescribed by the order sentorizing the multiple completion. Such seven shall also be connected on all multiple completions within seven days following recompletions and/or chamical or fracture resement, and whenever remarked work has been of done on a well during which the packer or the mixing have been dissurbed. Tests shall also be taken at any time that communication in suspected or when requested by the Division.
- At least 72 hours prior to the communications of any pacine insings uses, the operator shall existly
 the Division in writing of the cases time the test is to be communical. Offset operators shall also be so
 notified.
- 3. The packer laskage test shall commence when both zonus of the dual completion are shat-in for pressure subdiminion, both zonus shall remain shat-in until the well-lead pressure in each less subdition, provided however, that they need not remain shat-in more than seven days.

 4. For flow Test No. 1, one zone of the dual completion shall be produced at the normal rase of
- 4. For flow Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains above. Such test shall be consisted for zone days if the case of as well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage sent, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be stress hours.
- Following completion of flow Test No. 1, the well shall again be shut-in, in accordance with Paragraph 3 above.

the later the later to the second control of the later of

Flow Test No. 2 shall be conducted even though no lenk was indicated during flow Test No. 1.
 Procedure for Flow Test No. 2 is so be the same as for Flow Test No. 1

- and an each sentisply completed well within seven days after except that the provincel year shall remain shar-in while the year which theseafter as prescriped by the order authorizing the was provincely shar-in in produced.
 - 7. Preserves for gas-come mass must be measured on each sum with a deadweight preserve gauge at eine intervals as follows: 3 hours tests: intendiently prior to the beginning of each flow-period, at fifteen measure measurement fairing the first hour thread, and at hearty intervals thereafter, including one preserve measurement immediately prior to the flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow pariod. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test data.
 - 24-hour oil zone come all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and ence at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recenting gauge shall be required on the oil zone only, with deadweight pressures as required above being mines on the gas zone.
 - 8. The results of the above described tests shall be filed in triplican within 15 days after completion of the test. Tests shall be filed with the Aznec District Office of the New Mexico Oil Conservation Division of Northwest New Mexico Packer Lealings Test form Revised 10/01/78 with all deadweight pressures indicated thorson as well as the flowing temperatures (gas zones only) and gravity and GOR (oil zones only).
