NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 12. A packet leakage test shall be commenced on each multiply completed well within seven days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fesciture treatment, and whenever remedial work has been done on a well during which the packet or the tubing have been dissurbed. Tests shall also be taken at any time that communication is suspected or when requested by the Division.
- 2. At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in activing of the exact time the test is to be commenced. Offset operators shall also be so notified,
- 3. The packer leakage test shall commence when both zones of the dual completion are shut-in for pressure stabilization. Both zones shall remain shut-in until the well-head pressure in each his stabilized, provided however, that they need not remain shut-in more than seven days.
- 4. For Flow Ten No. 1, one zone of the dual completion shall be produced at the normal tase of production while the other zone remains shut-in. Such ten shall be continued for seven data in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packet leakage tent, a gas well it being flowed to the automphete due to the lack of a pipeline connection the flow period shall be three hours.
- 3. Following completion of Flow Text No. 1, the well shall again be shut-in, in accordance with Paragraph 3 above.
- 6 Piow Ten'No. 2 shall be conducted even though no leak was indicated during Flow Ten No. 1, Freeduit for Flow Ten No. 2 is to be the same as for Flow Ten No. 1 except

- that the previously produced zone shall remain shut in while the zone which was previous in shut in it produced.
- 7. Presource for gas-rone term must be measured on each zone with a deadwei pressure gauge at time intervals at follows: I hours term; immediately prior to the beging of each flow-period, at fifteen-minute intervals during the first hour thereof, and hourly intervals thereafter, including one pressure measurement immediately prior conclusion of each flow period, 7-day term; immediately prior to the beginning of a flow period, at least one time during each flow period (at approximately the mid point) and immediately prior to the conclusion of each flow period. Other pressure to take a desired, or may be requested on wells which have previously shown quonable test data.
- 24-hour oil zone tests: all pressures, throughout the entire test, shall be continuo meanired and seconded with recording pressure gauges the accuracy of which much checked at lean twice, once as the beginning and once as the end of each test, wi desdweight pressure gauge. If a well is a gas-oil of an oil-gas dual completion, the see ing gauge shall be required on the oil sone only, with deadweight pressures as requiable to the gas sone.
- 8. The results of the above-described tests shall be filed in triplicate within 13 days completion of the test. Tests shall be filed with the Aaree District Office of the New Mi-Oil Conservation Distrion on Northwest New Mexico Parket Leakage Test from Re-10-01-78 with all dead-eight pressures indicated thereon as well as the flotemperatures (gas cones only) and gravity and GOR (oil somes only).
