NORTHWEST NEWMEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- A packer leakage test shall be commenced on each multiply completed well within seven days after actual competion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and or chemical or fracture treatment, and whenever remedial work has been done on a well during which the packer or the trobing have been distribed. Tests shall also be taken at any time that communication is suspected on when requested by the Division.
- 2. At least 72 hours prior to the commencement of any packer leakage test, the operator shall north the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so northed.
- 3 The packer leakage test shall commence when both zones of the dual completion are shart-in for pressure stabilization. Both zones shall remain shart-in and, the well-haad pressure in each has stabilized, provided nowever, that they need not remain shart-in more than seven days.
- 4. For how Test No. 1, one zone of the dual completion shall be produced at the normal tate of production while the other zone remains shat-in. Such test shall be contained for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note lift on an initial packer leakage test la gas well is being flowed to the atmosphere due to lack of a pipeline connection the flow period shall be three hours.
- 5 Following completion of Flow Test No. 1: the wed shall again be shut-in in accordance with Paragraph 3 above.
- 6 Flow Test No. 2 shall be conducted even though no leak was indicated during how. Test No. 1. Procedure for Flow Test No. 2 is to be the same as for Flow. Test No. 1, except.

- that the previously produced zone shall remain shut-in while the zone which was previously shut-in is produced.
- 7 Pressures for gas-zone tests must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours tests immediately prior to the beginning of each flow period, at diffeon-minute intervals during the first hour thereof, and at nourly intervals, thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day tests, immediately prior to the beginning of each flow period at least one time during each flow period that approximately the madway point and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired or may be recuested on wells which have previously shown questionable test data.
- may be requested on wells which have previously shown questionable test data 25-hour oil zone tests, all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas datal completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gas zone.
- 8. The results of the above-described tests shall be filed in triplicate within 18 dars after completion of the test. Tests shall be filed with the Aziec District Office of the New Mexico Oil Conservation Division on Northwest New Mexico Packet Leakage Test Form Revised E+41-78 with all deadweight pressures indicated thereon as well as the tlawing temperatures sgas zones on a rand gavity and GOR (oil zones only).
