12. Describe Proposed or Completed Operations (Clearly state all pertinent details, and give pertinent dates, including estimated date of starting any proposed work) SEE RULE 1103.

It is proposed to effect a bradenhead repair on this wellbore according to the attached procedure and diagrams. This procedure will circulate cement from 1150' (50' below the Kirtland) to the surface which should adequately relieve the small pressure on the bradenhead and protect the Ojo Alamo and all surface water sources.

**Nye Com 1E
Bradenhead Repair
September 29, 1995**

Objective

Funds in the amount of \$10,000 are requested to repair the bradenhead on the Nye Com 1E. This well has activity on the bradenhead, and is located in a vulnerable/expanded vulnerable area. Recommended procedure is to rig up on the surface casing/production casing annulus with coiled tubing, run coiled tubing down to 450', and circulate cement to surface.

This project will not increase reserves, but will protect present production. The alternative to this repair is to abandon the wellbore. This project, along with the Mims 36 State Com 1, is an attempt to prove up cost effective coiled tubing bradenhead repairs.

Notes:

Bradenhead test results: Initial bradenhead pressure was 320 psi. Pressure dropped to 20 psi in 30 minutes. Gas flowed from bradenhead throughout test. Casing pressure remained constant at 265 psi.

Production casing consists of 3 jts 5-1/2" casing, 5-1/2" X 4-1/2" swedge, and 4-1/2" casing to TD.

Clearance between first three joints of 5-1/2" production casing and hole is only 2.575" through the collars. Assuming casing is centralized, this gives only 1.2875" to get the coiled tubing through.

Tubular Specs:

OD	GRADE	WT	ID	OD Cplg	BBL/FT	COLLAPSE	BURST	SF
8 5/8	J-55	24	8.097			960	2065	70%

NYE COM 1E
BRADENHEAD REPAIR
September 29, 1995

1. **Pre Work**

- A. Hold Safety Meeting and make sure all hot work permits are obtained before working on wellhead.
- B. Move onto well and dig out access to surface casing.
- C. Cut access hole in casing.
- D. Weld coiled tubing entry guide onto surface casing (see attached schematic).

2. **Rig Up Coiled Tubing Unit**

- A. Hold Safety Meeting before rigging up to discuss potential job hazards and meeting place in case of emergency.
- B. Install pressure gauges on tubing and casing, and monitor pressures throughout job to ensure that there is no communication between bradenhead and casing or tubing.
- C. Before coiled tubing comes on location, make sure end of coiled tubing is cut at a 45 degree angle, and the sharp end is rounded off.
- D. MI Coiled tubing unit, and position over entry guide.
- E. Feed CT into surface casing/ production casing annulus.

3. **Cement Surface Casing/Production Casing Annulus**

- A. RIH with coiled tubing to 450'.
- B. Establish circulation with H2O. Monitor tubing and casing pressure while pumping, to insure that water is not leaking into production casing. Make sure pressures do not exceed production casing collapse pressure.
- C. Hang and cut off coiled tubing (can use polished rod clamp as hanger).
- D. Rig up cementers.
- E. Pump cement down coiled tubing and circulate to surface.
- F. WOC. Rig down. Clean up location.
