NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A paciest leakage not shall be commenced on each studyly completed well within seven days after except that the provinced year shall remain shut in while the sons which actual completion of the well, and parently thereafter as projectived by the order authorizing the multiple completion. Such tests shall also be connected on all multiple completions within seven days following recompletion and/or chamical or fracture trustment, and whenever remedial work has been done on a well during which the pucher or the tabing have been disturbed. Tests shall also be taken at any time that communication is suspected or when required by the Division.

 2. At lower 72 hours prior to the communications of any packer leakage test, the operator shall notify
- the Division in writing of the exact time the test is to be commerced. Offset operators shall also be so notified.
- 3. The packer isologe use shall commence when both some of the deal completion are shed in for pressure stabilization. Both stones shall remain shot-in until the well-bend pressure in each has stabilized, provided however, that they used not remain shot-in store than seven days.
- 4. For flow Test No. 1, one zone of the dual completion shall be preduced at the normal state of production while the eater zone remains almoin. Such test shall be excessed for seven days if the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer lealings test, a gas well in being flowed to the atmosphase due to the lack of a pipeline connection the flow period shall
- 5. Following completion of flow Test No. 1, the well shall again be start-in, in accordance with Paragraph 3 above.
- 6. Flow Test No. 2 shall be condusted even though no look was indicated during flow Test No. 1. Processive for Flow Test No. 2 is to be the same as for Flow Test No. 1

- was previously shus-in is produced.
- 7. Pressures for gas-some tests must be measured on each some with a deadweight pressure gauge at time intervals as follows: 3 hours more: immediately prior to the beginning of each flow-period, at fifteen minute intervals during the first hour thereof, and at hourly intervals thereafter, including one presents measurement immediately prior to the flow period, at least one time during each flow period (st. antly the existency point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be required on wells which have previously shows questionable test data.
- 24-hour oil mans mans sul presentes, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas shall completion, the recenting gauge shall be required on the oil zone only, with deadweight pressures as required above being mines on the gaz zone.
- 8. The results of the above described tests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Azme District Office of the New Maxico Oil Conservation Division of Northwest New Maxico Pacter Leakage Test form Revised 10/01/78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas zones only) and gravity and GOR (oil zones only).
