Title DEPUTY OIL & GAS INSPECTOR, DIST. #3

NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

1. A packer leakage test shall be commenced on each multiply completed well within seven days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such test shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fracture treatment, and whenever remedial work has been done on a well during which the packer or the tubing have been disturbed. Tests shall also be taken at any time that communication is suspected or when requested by the Division.
2. At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact date the test is to be commenced. Office operators shall also be so notified.
3. The packer leakage test shall commence when both zones of the dual completion are shut-in for pressure stabilization. Both zones shall remain shut-in until the well-head pressure in each has stabilized, provided however, that they need not remain shut-in more than seven days.
4. For Flow Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shut-in. Such test shall be continued for seven days in the case of a gas well and for 34 hours in the case of an oil well. Note: If, on an initial packer leakage test, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be seven hours.
5. Following completion of Flow Test No. 1, the well shall again be shut-in, in accordance with Paragraph 3 above.
6. Flow Test No. 2 shall be conducted even though no leak was indicated during Flow Test No. 1. Procedure for Flow Test No. 2 is as for the same as for Flow Test No. 1 except

that the previously produced zone shall remain shut-in while the zone which was by shut-in is produced.

7. Pressure for gas-oil tests must be measured on each zone with a pressure gauge at time intervals as follows: 3 hours after immediately prior to the start of each flow-period, at fifteen-minute intervals during the first hour then hourly intervals thereafter, including one pressure measurement immediately at conclusion of each flow period, 7-day tests: immediately prior to the beginning flow period, at least one time during each flow period (at approximately 1/2 point) and immediately prior to the conclusion of each flow period. Other gauges may be used as desired, or may be requested on wells which have previously at suitable test data.

24-hour oil zone tests: all pressures, throughout the entire test, shall be measured and recorded with recording pressure gauges the accuracy of which checked at least twice, once at the beginning and once at the end of each deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, a recording gauge shall be required on the oil zone only, with deadweight pressure gauges being used on the gas zone.

8. The results of the above-described tests shall be filed in triplicate within 12 hours of the test. Tests shall be filed with the Area District Office of the N.O.C. Conservation Division on Northwest New Mexico Packer Leakage Test Form 10-01-78 with all deadweight pressures indicated thereon as well as all temperatures (gas zones only) and gravity and GOR (oil zones only).
