## NORTHWEST NEW MEDICO PACKER LEAKAGE TEST INSTRUCTIONS

- A packer leakage test shall be commenced on each multiply completed well within seven days after actual completion of the well, and annually thereafter as prescribed by the order, authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fracture treatment, and whenever remedial work has been done on a well during which the packer or the tubing have been disturbed. Tests shall also be taken at any time that commissiontion is suspected or when requested by the Division.
- At least 72 hours prior to the commencement of any packer leakage rest, the operator shall notify the Division in writing of the exact tame the sun is to be commenced. Offset operators shall also be so socified.
- 3 The packer leakage test shall commence when both zones of the dual completion are abut-in for pressure stabilization. Both zones shall remain shut-in until the well-head pressure in each has stabilized, provided however, that they need not remain shut-in more than seven days.
- 4. For Flow Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shar-in. Such sex shall be continued for zeven days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well is being flowed to the atmosphere due to the lack of a populate connection the flow period shall be three hours.
- 5. Following completion of Flow Test No. 1, the well shall again be shut-in, in accurdance with Paragraph 3 shove.
- Place Teat No. 2 shall be conducted even though no leak was indicated during Flow
  Teat No. 1. Precedure for Flow Teat No. 2 is to be the more as for Flow Test No. 1 except

- that the previously produced zone shall remain shut-in while the zone whish was previously shut-in at produced.
- 7. Pressures for gas-zone serts must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours term: intervals prior to the beginning of each flow-period, at fifteen-rausate intervals during the first hour thereof, and at hourly intervals thereafter, including one pressure measurement intraclistely prior to the conclusion of each flow period. 7-dov term: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway pound) and immediately prior to the conclusion of each flow period. Other possures may be taken as desired, or may be requested on wells which have previously above quantionable test data.
- 24-hour oil sone tents: all pressures, throughout the entire tent, shall be entitionally measured and recorded with recording pressure gauges the accuracy of which must be checked at least rwice, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gas asset.
- 8. The results of the above-described term shall be filed in triplicate within 13 days after completion of the test. Term shall be filed with the Asser District Office of the New Messer Oil Conservation Division on Northwest New Mexico Facher Leakage Test Form Revised 10-01-78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas some only) and gravity and GOR (oil soom only).
