HORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- A packer leakage test shall be commenced on each multiply completed will within seven days after across completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and/or themseal or fracture treatment, and whenever remedial work has been done on a well during which the packer or the rubing have been directed. Term shall also be taken at any time that communication is suspected or when requested by the Division.
- At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- The packer leakage test shall commence when both sones of the dual completion are shart-in for previous stabilization. Both zones shall remain shart-in until the well-head pressure in each has stabilized, provided however, that they need not restain short-in more than arranged.
- 4. For Flow Tert No. 1, one zone of the dual completion shall be produced at the normal case of production while the other zone remains share-in. Such test shall be communed for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packet leakage test, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- 5. Following completion of Flow Test No. 1, the well shall again be shot-in, in accordance with Pursgraph 3 shore.
- 6. Flow Text'No. 2 shall be conducted even though no leak was indicated during Flow Text No. 1. Procedure for Flow Text No. 2 is to be the same as for Flow Text No. 1 except

- that the previously produced zone shall remain shus-in while the zone which was previously shurt-in is produced.
- 7. Pressures for gas-zone term must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours term: immediately prior to the beginning of each flow-period, as fifteen-minute intervals during the first hour thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period, 7-day term: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test data.

14-hour oil some texts: all pressurer, throughout the entire text, shall be continuously measured and recorded with recording pressure gauges the accuracy of which some be checked at least rovier, once at the beginning and once at the end of each text, with decidweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil some only; with deadweight pressures as required above being taken on the gas some.

8. The results of the above-described terts shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Assec Dutters Office of the New Mexic Oil Conservation Division on Northwest New Mexics Packet Leakage Test Form Revue 10-01-78 with all deadweight pressures indicated thereon as well as the flowin temperatures (gas sense only) and gravity and GOR (oil sones only).
