Dear Frank,

This letter is to confirm our telephone conversation of Thursday, August 13, 1987 concerning flaring of the above well. As I mentioned, because this well is such a poor producer the gas gatherer, Sunterra Gas Gathering Company, wants to disconnect it. The current line pressure is +400 psi. We wish to flow the subject well with a 90 psi back pressure to simulate the line pressure of Union Texas Petroleum's Rudy Gathering System. If the well will produce sufficient gas at this lower line pressure, we may be able to justify tying it into our gathering system and, thereby, continue producing the well and recover additional reserves.

We anticipate beginning this three day test on Monday, August 17. Please call me if you have any questions.

Very truly yours,

*S. G. Katirgis*
