NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packet leakage test shall be commenced on each multiply completed well within seven days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fracture usaument, and whenever remedial work has been done on a well during which the packer or the rubing have been duringed. Tests shall also be taken at any time that communication is suspected or when requested by the Division.
 - 2. At least 72 lious prior to the commencement of any packer leakage test, the operator shall minify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
 - 3. The packet lexings test shall commence when both zones of the dual completion are shut in for pressure rabilitation. Both zones shall termain shut in until the well-head pressure in each has rabilited, provided however, that they need not termain shut in more than seven dark.
 - 4. For Flow Test No. 1, one zone of the dual completion shall be produced at the normal tast of production while the other zone remains shut-in. Such test shall be continued for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well is being flowed to the autosphere due to the lack of a pigeline connection the flow period shall be three hours.
 - 3. Following completion of Flow Test No. 1, the well shall again be shut-in, in accordance with Faragraph 3 shove.
 - 6. Fire Test No. 2 shall be conducted even though no leak was indicated during Flow Test Fig. 3. So offer for Fire Fig. 3. and is the same as for Low Test Fig. 1 except

- that the previously produced 2000 shall remain shut-in while the 2000 which was proly shut-in is produced.
- 7. Pressures for gas-zone term must be measured on each zone with a dead pressure gauge at time intervals at follows: 3 hours term: immediately prior to the 1 ing of each flow-period, at fineen-minute intervals during the farst hour thereof hourly intervals thereafter, including one pressure measurement immediately proconclusion of each flow period. 7-day term: immediately prior to the beginning flow period, at least one time during each flow period (at approximately the mission) and immediately prior to the conclusion of each flow period. Other pressure be taken as desired, or may be requested on wells which have previously shown tionable test data.

24-hour oil zone teru: all pressures, throughout the entire tert, shall be continued and recorded with recording pressure gauges the accuracy of which method at least rwice, once at the beginning and once at the end of each tert, deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the sing gauge shall be required on the oil tone only, with deadweight pressures as to above being taken on the gas tone.

8. The results of the shove-described tests shall be filled in triplicate within 13 day completion of the test. Tests shall be filled with the Azter Diracet Office of the New Oil Conversation Division on Northwest New Mexico Parker Leakage Test Form 10-01-78 with all desdweight pressures indicated thereon as well as the 1 temperatures (gas zones only) and graving and GOR (oil zones only).
