## NORTHWEST NEW MEDICO PACKER LEAKAGE TEST INSTRUCTIONS

I. A packer leakage tent shall be commenced on each multiply completed well within seven days after serval completion of the well, and annually therefore a prescribed by the order authorizing the multiple completion. Such term shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fracture desurence, and whenever remedial work has been done on a well during which the packet or the tubing have been distracted. This shall also be taken at any time that communication is suspected or when requested by the Division.

Commenced at flour, setal # #

- 2. At least 72 hours prior to the commencement of any packet leakage test, the operator shall needly the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- 3. The packer lexitage test shall commence when both zones of the dual completion are shurt-in for pressure trabilization. Both zones shall remain shurt-in until the well-head pressure in each has stabilized, provided however, that they need not remain shurt-in more than seven days.
- 4. For Pow Ten No. 1, one lone of the dual completion shall be produced at the normal rate of production while the other tone remains shut-in. Such ten shall be continued for seven days in the case of a gas well and for 14 hours in the case of an oil well. Note: if, on an initial packet leakage test, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- 3. Following completion of Flow Test No. 1, the well shall upon be shut-in, in screed dance with Paragraph 3 above.
- Flow Test No. 2 shall be conducted even though no leak was indicated during Flow Test No. 1. Procedure for Flow Test No. 1 is to be the same as for Flow Test No. 1 except

- that the previously produced took shall remain shut-in while the took which was previously shut-in is produced.
- 7. Pressures for gui-zone tests must be measured on each zone with a deadweight pressure grage at time intervals a follows: 3 hours tests: immediately prior to the beginning of each flow-period, at lifteen-minute intervals during the first hour theteol, and at hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day tests: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressure may be taken as desired, or may be requested on wells which have previously shown questionable test data.
- 16-hour oil sone testi: all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the securicy of which must be checked at least roice, once at the beginning and once at the end of each test, with a dead weight pressure gauge. If a well is a gas old or an od-gas dual completion, the recording gauge shall be required on the oil sone only, with dead-weight pressure as required above being taken on the gas sone.
- 8. The results of the above-described terts shall be filed in triplicate within 13 days after completion of the test. Tests shall be filed with the Arter District Office of the New Meuco Oil Conservation Dirition on Northwest New Meuco Packet Lethage Test Form Revised 10-01-78 with all deadweight pressures indicated thereon at well at the flowing temperatures (gas 2000 only) and gravity and GOR (oil 2000 only).
