## NORTHWEST NEW MEDICO PACKER LEAKAGE TEST INSTRUCTIONS

1. A packer leakage test shall be commenced on each multiply completed well within soon days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fracture treatment, and whenever remedial work has been done on a well during which the carket or the tubing have been disturbed. Tests shall also be taken at any time that communication is suspected or when requested by the Division.

DEPUTY OIL & GAS INSPECTOR, DIST. #3

- 2. At least 72 hours prior to the commencement of any packer leakage test, the operator call notify the Division in writing of the exact time the test is to be commenced. Offset peraton shall also be so notified.
- The packer leakage test shall commence when both zones of the dual completion are shut-in for pressure stabilization. Both zones shall remain shut-in until the well-head pressure in each has stabilized, provided however, that they need not remain shut-in more than seven days.
- 4. For Flow Ten No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shut-in. Such tent shall be continued for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage text, a gas well is being flowed to the autrosphere due to the lack of a pipeline connection the flow period shall be three hours.
- Following completion of Flow Test No. 2, the well shall again be shut-in, in accordance with Paragraph 3 above.
- Flow Terr'No. 2 shall be conducted even though no leak was indicated during Flow.
   Test No. 1. Procedure for Flow Terr No. 2 is to be the same as for Flow Terr No. 1 except

that the previously produced zone shall remain shur-in while the zone which was previously shur-in is produced.

11-21-86

7. Pressures for gas-zone term must be measured on each zone with a deadwe-observative gauge at time intervals as follows: 3 hours term: immediately prior to the beginning of each flow-period, as frieeen-minute intervals during the first hour thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day term: immediately prior to the beginning of each flow period, at learn one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown quintionable test data.

24-hour oil zone tests, all pressures, throughout the entire test, shall be continuous; measured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gas zone.

8. The results of the above-described term shall be filed in triplicate within 15 days after completion of the test. Term shall be filed with the Azter District Office of the New Messer. Oil Conservation Division on Northwest New Messer Packer Leakage Tert Form Revised 10-01-78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas somes only) and gravity and GOR (oil somes only).
