NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A pacine isalings test shall be commenced on each multiply completed well within seven days after except that the previously produced zone shall remain shut-in while the zone which actual completion of the well, and annually thereafter as prescribed by the order authorizing the mitiple completion. Such note shall also be connected on all multiple completions within seven days

 7. Pressures for gas-some tests must be measured on each zone with a deadweight following recompistion and/or obserical or fracture treatment, and when over somedial work has been done on a well during which the pacine or the tubing have been disturbed. Tests shall also be taken at any time that communication is suspected or when requested by the Division.

 2. At least 72 hours prior to the communication of any pacine leakage test, it
- At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify
 the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so
- 3. The pacine lealings test shall comacase when both mones of the dual completion are shut-in for 3. The protect statement was being to common abust-in until the well-head prossure in each has stabilized, provided however, that they need not seemin shut-in more than seven days.
- 4. For flow Test No. 1, one some of the dual completion shall be produced at the mormal rate of production while the other name semains shades. Such test shall be continued for seven days if the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well is being flowed to the atmosphere due to the mok of a pipoline composion the flow period shall be three hours,
- 5. Following completion of flow Test No. 1, the well shall again be shut-in, in accordance with Paragraph 3 above.
- 6. Flow Test No. 2 shall be conducted even though no leak was indicated during flow Test No. 1. Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1 $\,$

- was previously shut-in is produced.
- pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the beginning of each flow-period, at fifteen minute intervals during the first hour thoroof, and at hourly intervals thereafter, including one prese immediately prior to the flow period, at least one time during each flow period (at appearimentaly the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be inlien as desired, or may be requested on wells which have proviously shown questionable test data.
- 24-hour oil zone tests: all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of each test, with a dendweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recoming gauge shall be required on the oil zone only, with dondweight pro ics as required above being taken on the gaz zone.
- 8. The results of the above described tests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Astee District Office of the New Mexico Oil Conservation Division of Northwest New Mexico Packer Leakage Test form Revised 10/01/78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas zones only) and gravity and GOR (oil some only).
