NORTHWEST NEWMEXICO PACKER I EAKAGE TEST INSTRUCTIONS

- 1. A packer leasage test shall be commenced on each multiply completed well within seven days attra actual completion of the well, and annually thereafter as prescribed by the order actificity and the multiple completion. Such tests shall also be commenced on all multiple competions within seven days following recompletion and or chemical or fracture treatment, and whenever remedial work has been done on a well during which the packer or the tubing have been disturbed. Tests shall also be taken at any time that communication is suspected. If when requested by the Division.
- 2 At least 72 hours orior to the commercement of any packer leakage test, the operator shall notify the Draison in writing of the exact time the test is to be commenced. Offset operators—hall also be so notified.
- 3 The picker leakage test shall commence when both zones of the dual completion are shurf-in for pressure stabilization. Both zones shall remain shurf-in until the well-head pressure in each has stabilized, provided however, that they need not remain shurf-in more than seven has
- 4. For Low Test No. 1, one zone of the dual completion shall be produced at the normal rate of pro-action while the other zone remains shut-in. Such test shall be continued for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note if, on an initial picker leakage test a gas well is being flowed to the atmosphere due to tack of a pipeline colinection the flow period shall be three hours.
- 5 . Following comparison of Flow Test No. 1, the well shall again be shut-in, in accordance with Paray apri 3 above
- 6 Flow Test No. 2 shall be conducted even though no leak was indicated during Flow Test No. 1 Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1 except

- that the previously produced zone shall remain shat-in while the zone which was previously shut-in is produced
- 7. Pressures for gas-zone tests must be measured on each zone with a deacweight pressure gauge at time intervals as follows. 3 hours tests immediately prior to the beginning of each flow period, at fifteen-minute intervals during the first hour thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day tests: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test data.

24-hour oil zone tests, all pressures, throughout the entire test, shall be continuous is measured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gus dual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gas zone.

8 The results of the above-described tests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Aztec District Office of the New Mexico Oil Conservation Division on Northwest New Mexico Packer Leakage Test Form Revised 10-01-78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas zones only) and gravity and GOR foil zones only).
