The elevation of the derrick floor above sea level is 6,353 ft.

DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudlogging jobs, cementing points, and all other important proposed work)

Intention to drill this well was approved subject to protection of the Mesa Verde formation. After drilling to 8,073' RKB, well was plugged back to 8,067' and 265 joints of 5 1/2" OD 17# N-80 casing (8,066') were set with Baker stage tool 2049' off bottom. First stage cemented with 230 sacks 50/50 Pozmix "S", 2% gel, .4% W-4. Plug down 6:45 A.M. on 6/21/60. Set casing 2' off bottom shoe at 8065' with stage collar at 6016'. On 6/22/60 opened Baker stage tool - circulated 20 barrels gel, water and mud followed by 150 sacks 50/50 Pozmix "S" with 2% gel and 15# Gilsomite per sack. At 7:00 p.m. closed stage tool with 2300# pressure - set slips and released rig. Cable tool to be used for completion.

If conditions warrant well will be dually completed in both Mesa Verde and Dakota formations.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
