NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

 A packer leakage sest shall be commenced on each multiply completed well within seven days after screal completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and/or cheroid or fracrure treasment, and whenever remedial work has been done on a well during which the packet or the tubing have been directed. Tests shall also be taken at any time that commissionion is suspected or when requested by the Division.

mend of from, date) ^{a a}

- At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified."
- 3. The packer leakage test shall commence when both zones of the dual completion are shutt-in for previous stabilization. Both zones shall remain shut-in until the well-head pressure in each has stabilized, provided however, that they need not remain shut-in more than come does.
- 4. For Prov Tex No. 1, one some of the dual completion shall be produced at the normal rate of production while the other some remains short-in. Such text shall be continued for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage text, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- 5. Following completion of Flow Test No. 1, the well shall again be shost-in, in accordance with Paragraph 3 above.
- 6. Flow Text'No. 2 shall be conducted even though no leak was indicated during Flow Text No. 1. Procedure for Flow Text No. 2 is so be the same as for Flow Text No. 1 except

- that the previously produced zone shall remain show-in while the zone which was previously short-in is produced.
- 7. Pressures for gas-zone text must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours text: somedistely prior to the beginning of each flow-period, at lifeten-manute intervals during the first hour thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day texts: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable text data.
- 14-hour oil zone tests: all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least rover, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is gue-oil or an oil-gus dual completion, the recording gauge shall be required on the oil zone only; with deadweight pressures as required above being taken on the gus zone.
- 8. The results of the above-described tests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Amer Dutties Office of the New Mexico Oil Conservation Division on Northwest New Mexico Packer Leakage Test Form Revised 10-01-78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas 2000x only), and gravity and GOR (oil 2000x only).
