DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

Ute Mountain Tribal "G" Well No. 4 was spudded on February 17, 1959, and on February 18, 1959, 8-5/8" casing was set at 218' with 160 sacks of cement with 2 percent calcium chloride. After waiting on cement, casing and water shut-off were tested with 400 pounds pressure for thirty minutes, which held with no drop in pressure. Reduced hole to 7-7/8" at 218' and resumed drilling operations.

On February 25, 1959, 5-1/2" casing was set at 3478' with two-stage cement tool at 3030'. Cemented first stage with 75 sacks 6 1/2 gal cement with two pounds Tuf-Plug per sack. Tested casing with 3000 pounds pressure for fifteen minutes, which held with no drop in pressure. Opened 2-stage ports with 1200 pounds and circulated for 4 hours with no cement returns. Cemented second stage with 350 sacks 6 1/2 gal cement with 2 pounds Tuf-Plug per sack. Lost circulation during last 2 barrels displacement. (See reverse side.)

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
