NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packer lesings sest shall be communiced on each multiply completed well within seven days after except that the previously produced zone shall remain stee-in while the zone which actual completion of the well, and assuably thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be connected on all multiple completions within seven days 7. Pressures for pre-mone tests must be unsured on each some with a deadweight following recompletion and/or chemical or frac-ture trustment, and whenever remedial work has been done on a well during which the packer or the subing have been dispurbed. Tests shall also be taken at
- any time that communication is suspected or when requested by the Division.

 2. At least 72 hours prior to the communication of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be communed. Offset operators shall also be so
- 3. The pecker leakage test shall commence when both zones of the dual completion are shall in for on, both somes shall remain shut-in until the well-head pressure in each las stabilized, provided however, that they need not remain shut-in more than seven days.
- 4. For flow Test No. 1, one some of the dual completion shall be produced at the normal rate of production while the other zone remains shut-in. Such test shall be continued for seven days if the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage seat, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- 5. Following completion of flow Test No. 1, the well shall again be shat-in, in accordance with Paragraph 3 above
- 6. Flow Test No. 2 shall be conducted even shough no leak was indicated during flow Test No. 1. Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1

- was previously sheet in in produced.
- pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the beginning of each flow-period, at fifteen minute intervals during the first hour thereof, and at hourly inservals thereafter, including one press redictely prior to the flow paried, at least one time during each flow period (at mly the unidway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells maly shows questionable test data. which have provi
- 24-hour oil some mate: all pressures, throughout the entire test, shall be usly monuted and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and cace at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the seconding gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gaz zone.
- 8. The results of the above described tests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Astec District Office of the New Mexico Oil Comervation Division of Northwest New Mexico Packer Leakage Test form Revised 10/01/78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas zones only) and gravity and GOR (oil zones only).
