Figure 1 is a line graph illustrating the relationship between age and body fat percentage. The Y-axis represents the percentage of total body weight in fat, ranging from 0 to 30 in increments of 5. The X-axis represents age in years, ranging from 0 to 100 in increments of 20. The graph shows a continuous upward trend, with the percentage of body fat increasing from approximately 10% at age 0 to about 25% at age 100. The rate of increase appears to be more pronounced between ages 40 and 60.
