NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packer indege set shall be commenced on each swittiply completed well within seven eaver after accept that the previously produced some shall remain shar-in while the some which actual completion of the well, and annually thereafter as prescribed by the order authorizing to:

 was previously alian-in its produced. multiple completion. Such tests shall also be connected on all multiple completions within seven days following recompletion and/or chamical or frac-ture treatment, and whenever remedial work resi been presented or frac-ture treatment, and whenever remedial work resi been presented or frac-ture treatment, and whenever remedial work resi been presented or frac-ture treatment, and whenever remedial work resi been presented or frac-ture treatment, and whenever remedial work resi been presented or frac-ture treatment and the presented or frac-ture treatment. done on a well during which the packer or the mixing have been disturbed. Tests ahali also be cates at any time that communication as suspected or when requested by the Division.

 2. At least 72 hours prior to the communication of any packer leakage aces, the operator shall notify
- on in writing of the exact time the test is to be communical. Offset operators shall see be so
- 3. The packer leakage test shall commence when both zones of the dual completion are stur-in for pressure stabilization. Both some shall remain that in until the well-head pressure in each test stabilized, provided however, that they used not recenin shut-in more than seven days.
- 4. For flow Test No. 1, one some of the dual completion shall be produced at the normal rate of production while the other zone remains shar-in. Such test shall be continued for seven days if the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period small be three hours.
- 5. Following completion of flow Test No. 1, the well shall again be shut-in, in accordance with Paragraph 3 above.
- 6. Flow Test No. 2 shall be conducted even though no leak was indicated during flow Test No. 1. Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1

- pressure gauge at time intervals as follows: 3 hours tests: instediately prior to the beginning of each flow-period, at fifteen minute intervals during the first hour thereof, and at hearly intervals thereafter, including one pressure mass immediately prior to the flow period, at least one time during each flow period (at unity the midway point) and immediately prior to the conclusion of each floor paried. Other pressures may be taken as desired, or may be requested on wells which have previously shows quasicomble test data.
- 24-hour oil zone tests: all presentes, throughout the entire test, shall be continuously assumed and recorded with recording presente gauges the accuracy of which must be checked at least twice, once at the beginning and ence at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gaz some.
- 8. The results of the above described tests shall be filed in triplicate within 15 days. after completion of the test. Tests shall be filed with the Aziec District Office of the New Mexico Oil Comervation Divinion of Northwest New Mexico Packer Lenkage Test form Revised 10/01/78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas zones only) and gravity and GOR (oil zones only).
