NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- A pacter leakage test shall be commenced on each multiply compared well within seven days after except that the previously produced zone anall rectain shall while the zone which actual completion of the well, and amusely thereafter as prescribed by the order authorizing the mustrate completion. Such tests shall size be connected on all multiple completions within seven days following recompletion and/or enemoti or frac-ours treatment, and whenever remedial work has occudone on a well during which the packet or the mixing have been disturbed. Tests shall also be taken at any time that communication is suspected or when requested by the Division.
- 2. At seast 72 hours prior to the commencement of any pacter lealings test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so
- 3. The nacizer leakage test shall commence when both zones of the dual completion are shut-in for pressure stabilization, both zones shall remain shar-in until the well-head pressure in each has standized, provided however, that they need not remain statem more than seven days.
- 4. For flow Test No. 1, one zone of the dual completion small be produced at the normal rate of production while the other zone remains shar-in. Such test shall be constitued for seven days if the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial nactor lealings test, a gas well is being flowed to the atmosphere due to the lack of a pinetime connection the flow period small he three nours.
- 5 Following completion of flow Test No. 1, the well shall again be size-in, in accordance with Paragraph 3 above
- 6. Flow Test No. 2 shall be conducted even though no look was indicated during flow Test No. 1. Processure for Flow Test No. 2 is to be the same as for Flow Test No. 1

- was previously state-in is produced.
- 7. Pressures for gas-zone tests must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the beginning of each flow-period, at fifteen minute intervals during the first hour thereof, and at hourty intervals thereafter, including one pressure measurement immediately prior to the flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the concrusion of each flow period. Other pressures may be taken as desured, or may be requested on wells which have previously shown questionable test data.
- 24-hour oil zone tests: all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of each test, with a dends wight pressure gauge. If a well is a gas-ou or an oil-gas qual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gaz zone.
- 8. The results of the above described tests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Azice District Office of the New Mexico Oil Conservation Division of Northwest New Mexico Pacier Lexitage Test form Revised 10/01/78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas zones only) and gravity and GOR (oil zones only).
