NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packer leakage test shall be commenced on each multiply completed well within seven days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fracture treatment, and whenever remedial work has been done on a well during which the packer or the tubing have been disturbed. Tests shall also be taken at any time that communication is suspected or when requested by the Division.
- 2. At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- 3. The packer leakage test shall commence when both zones of the dual completion are shut-in for pressure stabilization. Both zones shall remain shut-in until the wellhead pressure in each has stabilized, provided however, that they need not remain shut-in more than seven days.
- 4. For Flow Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shut-in. Such test shall be continued for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note: If, on an initial
- stage test, a ges well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- 5. Following completion of Flow Test No. 1, the well shall again be shut-in, in accordance with Paragraph 3 above.
- 6. Flow Test No. 2 shall be conducted even though no leak was indicated during Flow Test No. 1. Procedure for Flow Test no. 2 is to be the same as for Flow Test No. 1 except

- that the previously produced zone shall remain shut-in while the zone which w previously shut-in is produced.
- 7. Pressures for gas-zone lests must be measured on each zone with a deadwork pressure gauge at time intervals as follows: 3 hours tests: immediately prior to 1 beginning of each flow-period, at fifteen-minute intervals during the first hour there and at hourly intervals thereafter, including one pressure measurement immediate prior to the beginning of each flow period, at least one time during each flow peri (at approximately the midway point) and immediately prior to the conclusion of ca flow period. Other pressures may be taken as desired, or may be requested wells which have previously shown questionable test date.
- 24-hour oil zone tests: all pressures, throughout the entire test, shall continuously measured and recorded with recording pressure gauges the accura of which must be checked at least twice, once at the beginning and once at the eof each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-g dual completion, the recording gauge shall be required on the oil zone only, w deadweight pressures as required above being taken on the gas zone.
- The result s of the above-described tests shall be filed in triplicate within 15 da after completion of the test. Tests shall be filed with the Aziec District Office of II New Mexico oil Conservation Division on northwest new Mexico packer leakage Te Form Revised 11-16-98 with all deadweight pressures indicated thereon as well: the flowing temperatures (gas zones only) and gravity and GOR (oil zones only)
