NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packer leakage test shall be commenced on each multiply completed well within seven days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fracture treatment, and whenever remedial work has been done on a well during which the packer or the tubing have been disturbed. Tests shall also be taken at any time that communication is suspected or when requested by the Division.
- 2. At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- 3. The packer leakage test shall commence when both zones of the dual completion are shut-in for pressure stabilization. Both zones shall remain shut-in until the well-head pressure in each has stabilized, provided however, that they need not remain shut-in more than seven days.
- 4. For Flow Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shut-in. Such test shall be continued for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.

- that the previously produced zone shall remain shut-in while the zone which was previally shut-in is produced.
- 7. Pressures for gas-zone tens must be measured on each zone with a deadwe pressure gauge at time intervals as follows: 3 hours tens: immediately prior to the beging of each flow-period, at fifteen-minute intervals during the first hour thereof, an hourly intervals thereafter, including one pressure measurement immediately prior to conclusion of each flow period. 7-day tens: immediately prior to the beginning of 6 flow period, at least one time during each flow period (at approximately the mich point) and immediately prior to the conclusion of each flow period. Other pressures 1 be taken as desired, or may be requested on wells which have previously shown qualitonable test data.

24-hour oil zone tests: all pressures, throughout the entire test, shall be continuous measured and recorded with recording pressure gauges the accuracy of which must checked at least twice, once at the beginning and once at the end of each test, wit deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required by the pressure on the gas zone.

8. The results of the above-described tests shall be filed in triplicate within 15 days a completion of the test. Tests shall be filed with the Aztec District Office of the New Mer. Oil Conservation Division on Northwest New Mexico Packer Leakage Test Form Revi
