The elevation of the derrick floor above sea level is 5435 ft.

DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

Total depth 1062'. Plugged back depth 1052'.

After cementing 3-1/2" casing at 1057', cement plug was drilled out to 1052'. Perforated 3-1/2" casing from 1037' to 1045' with 20 shots. Spotted 100 gallons of mud acid over perforations and broke down formation with 1700# pressure. Treated perforations with 18,480 gallons of crude oil containing 18,000# of 10-20 sand and 1000# of adomite. After swabbing 100 barrels of load oil, installed pumping equipment and commenced pumping well. After pumping well for 1-1/2 months, 208 barrels of load oil was still not recovered. This load oil was charged off and well was tested for an allowable. On 24 hour test ending 2-1-62, well pumped 5 barrels of 40° gravity oil.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
