## WORKOVER PROCEDURE - BRADENHEAD REPAIR

NYE # 3

Pictured Cliffs/Mesaverde Dual

SW/4 Sec. 1, T30N, R11W

San Juan Co., New Mexico

DPNO 53578 (PC); 53579 (MV)

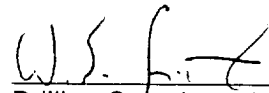

1. Comply to all NMOCD, BLM, and MOI regulations. Conduct daily safety meetings for all personnel on location.
2. Test location rig anchors and repair if necessary. Prepare blow pit. MOL and RU daylight pulling unit. Install a 400 bbl frac tank and an atmospheric blow tank. NU blooie line to blow pit, and relief line to atmospheric tank. Fill frac tank with 1% KCl water.
3. Blow down well to atmospheric tank. Control well with 1% KCl water as needed. ND wellhead and NU BOP's. Test and record operation of BOP's. Send wellhead to A-1 Machine for inspection.
4. PU on production tubing (4292' of 1 1/2", 2.9#, EUE), unseat from packer (3 1/2" Baker Model D @ 4250'), and strap out of hole. Replace joints of tubing that are in bad condition. Note any buildup of scale, and notify Operations Engineer.
5. RU wireline unit. Run gauge ring inside intermediate casing (5 1/2", 15.5 ppf) to 2450'. PU 5 1/2" RBP and 2 3/8" workstring. TIH and set RBP at 2450'. Pressure test casing to 1000 psig. Spot two sacks of sand on top of RBP.
6. TOC is 2370' per cement bond log. Contact Operations Engineer for design of squeeze cement.
7. Perforate 4 squeeze holes at 2360'. TIH with 5 1/2" fullbore packer and set 200' above squeeze holes. Pressure up backside to 500 psig. Establish rate into perforations with bradenhead valve open. Max pressure 1500 psig.
8. Mix and pump cement slurry. (If cement circulates to surface, go to tail slurry.) Displace cement to packer, close bradenhead valve and squeeze 2 to 3 bbl of cement into perforations. Release packer, pull up hole one stand, reverse circulate, and reset packer. Re-apply squeeze pressure and WOC 12 hours (overnite).
9. Release packer and TOH. TIH with 4 3/4" bit and drill out cement. Pressure test casing to 1000 psig. Test bradenhead valve for flow. Re-squeeze as necessary to hold pressure, or to shut-off bradenhead flow.
10. TIH with retrieving tool and retrieve RBP from 5 1/2" casing. POOH and LD RBP. Clean out to top of 5 1/2" packer (at 4250') with 4 3/4" bit. POOH. TIH with 2 1/4" mill and tapered workstring (packer bore ID 2.688"). CO to PBTD (at 4900') with air. Blow well clean and gauge production. POOH. PU 5 1/2" packer and TIH. Set below PC perforations, and flow test PC and MV formations independently. POOH.

11. TIH with production tubing (seating nipple with pump-out plug one joint off bottom; 570' of 1 1/4", 2.3# tailpipe required). Land tubing at 4820' with seal assembly seated in packer at 4250'.
12. ND BOP's and NU wellhead. Pump plug from tubing. Obtain final gauges.
13. Release rig.
