Mr. Asher:

Please be advised that the

- Release area is in core LPC habitat. BLM timing stipulations are in effect.
- Depth to groundwater was assessed incorrectly. There are other USGS wells (attached) that are closer and have more recent data than the ones identified in the report. Also, the one with the most recent data is hydrologically upgradient from the release location. Depth to groundwater is estimated to be approximately 50 ft. bgs.
- A caliche layer is not an acceptable rationale for incompleteness of vertical delineation.

Based on the revised RRALs, release characterization (vertically and horizontally) is not complete for 1RP-4826. Furthermore, as indicated in the email dated December 29, 2017, a proportion of the samples need laboratory analyses of chlorides for verification. This report does not have any data related to chlorides.

Thanks,
Olivia
