### HOBBS OCD

JUL 2 4 2014

RECEIVED

Mr. Keith Herrmann, Assistant General Counsel State of New Mexico Energy, Minerals and Natural Resources Oil Conservation Division 1220 South St. Francis Drive Santa Fe, NM 87505

Dear Mr. Herrmann:

Re: NMOCD-Agreed Compliance Order ACO-282 Booher 35 No. 3, API # 30-005-20843 Well Plugging and Abandonment (NE/4)-1,980' FNL and 330' FEL of the Section Unit H, Section 35-T7S-R31E, Chaves Co., New Mexico

On May 27, 2014, Anadarko Petroleum Corporation (APC) signed the Agreed Compliance Order (ACO) NMOCD-ACO-282 issued by the State of New Mexico - Energy, Minerals and Natural Resources Department (EMNRD), Oil Conservation Division (OCD), fully executed on June 2, 2014.

APC has complied with ACO-282 by bringing the Booher 35 No. 3 into compliance with the OCD Rule 19.15.25.8 NMAC by the due date of July 28, 2014. The well bore was plugged in accordance with OCD Rules 19.15.25.9 NMAC through 19.15.25.11 NMAC. Plugging activity was completed on July 17, 2014.

Significant delays and scope changes during this plugging and abandonment effort were communicated to the NMOCD District I office in Hobbs as encountered, and included Lesser Prairie Chicken (LPC) survey and waivers, sour gas flaring under permit exception, and hole conditions different than originally submitted on the Form C-103. APC appreciates the guidance and responsiveness of Maxey Brown of the Hobbs office throughout this process.

APC hereby submits the required Form C-103 which describes the work completed, along with the following documentation provided as Attachments:

JUI 20 2014

- OCD approved Form C-103 with planned well plugging diagram (Attachment A)
- Site Location Map (Attachment B)
- Chronology of events from June 17, 2014 to July 17, 2014 (Attachment C)
- Booher 35 No 3, final well plugging schematic as of July 17, 2014 (Attachment D)
- Photographic documentation of the well cap and casing cut off below the surface (Attachment E)

If you have questions, please feel free to contact me at (832) 636-3469.

Regards,

John Evanoff HSE Advisor

Cc with Attachments: Linda Kuhn - Anadarko David McBride – Anadarko Maxey Brown – OCD District I Office Conditions of Approval (if any):

1. Due to new Federal Rules for Threatened and Endangered Species with respect to the Lessor Prairie Chicken (LPC), Anadarko cut the surface casing and production casing to a depth of 4 feet below the ground surface and welded a steel cap on the well with the information discussed above. (see photo)

This portion of Chaves County has been identified by the Federal Government as critical habitat for the preservation of the LPC. Therefore Anadarko understands the importance of following the conservation plan which is why the well casing was buried.

- 2. The Booher 35 No 3 was a dry hole and never had any flow lines, tanks or surface pumping equipment. The well was considered for disposal well at one time, but never was converted.
- 3. Attached to the C-103 Form is a) Site Location Map, b) chronology of events, c) well plugging diagram, d) photographic documentation.

\$ 7/22/14

### Anadarko Petroleum Corporation, Booher 35 Well No. 3. Chaves County, NM Chronology of Events Starting June 16, 2014.

#### Subject: Monday, June 16, 15:00

Christine Mathews with CRA and John Crider with Nabors met at the site and surveyed the well pad and surrounding area for signs of Lessor Prairie Chicken critical habitat. None was observed onsite or surrounding the site.

#### Subject: Tuesday, June 17, 15:00

Mobilize to the site with equipment and crew, begin moving in and staging at the site.

### Subject: Wednesday, June 18, 15:00

Nabors is inspecting equipment, H&S meeting with crew, go over JSAs, rig up, continue staging equipment at the site. Attempt to bleed off well, valves are frozen start calling vendors to support hot tap.

#### Subject: Thursday, June 19, 15:00

H&S briefing is conducted with crew, go over JSAs, prepare tubing connections, catwalk and pipe racks. Received fresh water delivery, prepare well head for CUDD to hot tap.

#### Subject: Friday, June 20, 15:00

Nabors and CRA mobilized to the site, onsite at 09:00. Prep site and pipe for CUDD to arrive and hot tap, hold safety meeting @ 11:00 when CUDD arrived, rigged up equipment and started to hot tap after safety meeting and completed near 13:00. Rigged down CUDD and rig up flowline, opened valve to half tank, immediately H2S alarms went off showing 109 ppm, shut in well, call PM, standby for orders, shut down for day around 15:00

#### Subject: Saturday, June 21, 15:00

Nabors on Standby, John Crider and Kevin Howard are locating equipment to hot tap again so we can flare H2S gas. CRA has contacted Total Safety, Boots & Coots, and Express Energy Service. Calling tool companies to find a 4.5 inch bridge plug for the bottom of the well. B&C and Express are locating equipment and labor to support.

#### Subject: Sunday, June 22, 15:00

Nabors on Standby, crew drove to the site to check equipment, continue to call service providers

#### Subject: Monday, June 23, 15:00

Nabors on Standby, we are making progress on locating equipment to support additional hot tap

#### Subject: Monday, June 23, 15:00

Nabors on Standby, waiting on third party support with equipment and labor

#### Subject: Tuesday, June 24, 15:00

Nabors on Standby, waiting on third party support with equipment and labor

# Subject: Monday June 30 08:00 (Friday June 27, Saturday June 28 and Sunday June 29 Record) OVER THE WEEKEND REPORT "Cassie":

#### Kevin/John

We flared on Friday (June 27) for about 2.5 hours. Upon bleeding the pressure to 0 psi, H2S was still reading 14,000 ppm. Boots and Coots hot tapped under supplied air following flare operations. Friday evening Nabors attempted to begin pumping salt gel through the hot tap to kill the H2S, but an obstruction was found in the valves of the pump truck and was not recovered by 7pm.

Saturday morning (June 28) Nabors cleared the obstruction. We cracked the valves on the hot tap under supplied air prior to pumping, at which time 99.9 LEL and 88 ppm H2S was found. Another flare operation took approximately 10-20 seconds to burn off the accumulated methane and H2S. Nabors changed the valves under supplied air, and pumped approximately 70 bbls of salt gel into the well. H2S was still seeping at which point the well cap was removed and a blowout preventer installed under supplied air with plans to start running the scraper under supplied air. Everything was rigged up and the scraper ready by 7 pm Sunday night.

Sunday (June 29) we'll start running pipe under supplied air.

Air monitoring during operations were consistently 0 for SO2, H2S, CO, and LEL at the secondary muster and all perimeter locations. The pad was cleared for re-entry by total safety after all supplied air jobs, air monitoring conducted by CRA on the pad was consistently 0 for all constituents.

Cassie

#### Subject: Monday June 30 08:53 "Cassie":

We started out the day with Fesco onsite to rig down. They were finished and offsite by around 11:15 am.

After a pre-job safety meeting, nonessential personnel moved to the secondary muster while Nabors attempted to run a scraper under supplied air. Attempts to run a scraper down hole were unsuccessful due to an 8 5/8 adapter.

CRA conducted air monitoring of the secondary muster and perimeter while supplied air operations were underway.

Nabors removed the blowout preventer and Larkin head, attempt to remove adapter. By 1650, the attempts to remove the adapter were unsuccessful. Nabors needs a bigger set of chain tongs to get the adapter out. Nabors is locating one, hopefully to be here by tomorrow morning.

Cassie

#### On Jun 30, 2014, at 16:17, Clarification email on questions:

The initial H2S reading of 109 ppm is what came out of the hot tap installed by CUDD. John Crider cracked the hot tap, the alarm at the half frac went off, and the valve was immediately closed. After about 20 minutes, John checked the alarm at the half frac, it read 109 ppm.

14,000 ppm was recorded during flaring operations Saturday. It came from a flow line off the hot tap to the separator. A colorimetric tube was pulled that read 14,000 ppm H2S. Another tube was pulled off the hot tap on the backside on Sunday prior to changing the valves, there was again 14,000 ppm recorded.

I believe the model was set at 1000 ppm H2S. Steve Grace and I collected air monitoring readings from the secondary muster point, and various locations up to about 4 miles out. These locations were designated by Steve and I on day 1 of air monitoring. As the wind direction fluctuates, we are trying to find roads to get to locations downwind. We also collected readings from the pad while on location. If the iPad is uploading real time, Dyron should be able to give you exact locations. I've tried twice to

download info to my computer in the evenings but I don't believe I have the correct software. My perimeter readings didn't go as far out yesterday, since we only flared for a few seconds. I did try to grab some perimeter readings while the well was open during the blowout preventer install.

Boots and Coots saddles were left on the well after their hot tap. They stuck around for the remainder of Saturday and until about 1100 MDT Sunday waiting to get their saddles back. An agreement was made that boots and coots could leave the location and that john Crider would get their saddles back to them once Nabors has a chance to change the valves.

Fesco rigged down the flare this morning and was off location at 11:15.

As I understood it, CRA would continue air monitoring until the well reaches static pressure, either after pumping enough salt gel down hole, or after setting a plug. At this point it looks like we'll have to set a plug and get some concrete on it before we can cut off the H2S. After the H2S has been controlled, CRA will remain onsite to oversee the plugging of the well.

Nabors asked if Anadarko wants them to shut down for the fourth. They prefer to work straight through. Please let us know ASAP, as our hotels are filling up fast.

Cassie

#### Subject: July 1, 2014 "Cassie":

Nabors located the chain tongs they needed and had it onsite by shortly after 10:00 am this morning. The larkin head and blowout preventer were removed to access the 8 5/8 adapter. A Huber rubber inside the 8 5/8 adapter was removed and the larkin head and blowout prevent were placed back on the well. All of these operations took place under supplied air with non-essential personnel at the secondary muster.

Nabors began running the scraper while under supplied air. No further obstructions were found in the well and they hit 4,023 feet bgs at around 5pm.

Site operations ended this evening with Nabors tripping out the scraper. All personnel were offsite by 7:15 New Mexico time.

Kevin I know we talked about getting a wire line, the earliest John can get one from Nabors here would be Sunday. Tomorrow we can finish tripping out and set the plug, then try to pump a little cement on it, but after that we'll need a wire line to set the cement with a dump bailer. John said a company called Grey Line might have one.

I'm heading home for a few days, Jeff Walker from our Albuquerque office will take over for me. Steve Grace from the Atlanta office is going to be doing the air monitoring along with Jeff.

Cassie

#### On Jul 2, 2014, at 11:28 PM, "Walker, Jeffrey"

All site personnel (Nabors, Total Safety and CRA) made it to the site by 0900 despite muddy roads from heavy rain overnight. After tailgate safety meeting, Nabors resumed tripping scrapper out of well. Scraper was able to attain TD indicating well was open to the bottom. Two Nabors' water trucks from Hobbs arrived on site at 1050 and transferred a total of 240 bbls to onsite storage tank. Just after noon Nabors tripped back in well to attempt to set mechanical bridge plug at 4000 ft.

At 1400 ball for the bridge plug was dropped and drill string sheared from plug and well pressured up to check success of plug. The plug apparently failed. Nabors began introducing salt gel into the well to circulate out residual formation oil to make ready for wireline rig. Because circulation of salt gel would also result in purging well of remaining H2S, an attempt to obtain a quantitative reading on H2S was planned. A Total Safety technician (under supplied air) was to draw a Drager tube sample and also gauge with Rae detector. An approaching lightning storm with threat of additional heavy rain cut the salt gel circulation and H2S gauging event short.

All down hole work continues to be done under supplied air at maximum 45 minute intervals with 10-15 minute breaks. Nonessential personnel meanwhile relocate to secondary muster location approx. 1\3 mi. offsite. CRA continue to conduct air monitoring for H2S periodically on site while well is shut in, and at downwind locations while down hole work is being conducted. Other than previously reported concentrations of H2S on site (when well first opened after Cudd hot tap and during flaring) there have been no concentrations of H2S measured either on site or at any offsite monitoring locations.

Nabors is attempting to get a wireline sub on site ASAP to set the plug and to ascertain casing integrity via geophysical log. Uncertain as to when appropriate wireline rig can be on site. Nabors will continue with circulation of salt gel in the morning.

John Crider had communicated status of P&A progress today directly to Kevin Howard via telephone.

Real time air monitoring data and site observations recorded on iPad from yesterday and today has been uploaded to share site this evening.

#### Subject: Thursday, July 3, 2014 "Kevin Howard"

Attempting the secure correct wireline truck with nickel coated wireline, contacted Express Oil Service and he is attempting to locate a truck. CRA and Nabors called off attempt to circulate salt gel due to fear of fluid loss in the open perforations. Nabors on standby most of the day. With all the frustration it was decided by CRA, APC and Nabors to shut down for the holiday and return to the site on Tuesday, July 8.

#### Subject: Wednesday, July 9, 08:00 am (Tuesday, July 8, events)

Total Safety brought additional air this morning and some time was spent moving trailers around and readying equipment to run pipe downhole. Viton coated bridge plugs were built by Tryton Tool Services USA and being shipped to the well site. The plug is expected to be at the well site Thursday evening, July 10 and Express Oil Service is set to b on site Friday Morning, July 11 with a wireline truck.

At approximately 10:30 am New Mexico time all non-essential personnel moved to the secondary muster point while Nabors went under supplied air to run pipe to 3,920 ft bgs to attempt to plug perfs at 4,027' bgs. Nabors pumped 25 sacks clean neat class C cement and then 15 barrels of salt gel to clear tubing.

The Cement will need to set for at least four hours subsequently the well was shut in for the night at 15:30. In the morning we will mobilize to the site and tag the bottom of the well to see where the cement set up.

CRA conducted air monitoring of the pad prior to and following supplied air operations, and of the secondary muster point while Nabors worked under air.

#### Subject: Thursday, July 10, 08:00 am (Wednesday, July 9, events)

Tryton Tool Service is building the Viton coated bridge plugs and will ship out later today. Nabors ran down the hole with tubing and did not find the top of the cement placed yesterday, formation appears to have taken the cement. Will shut down and wait on plug to show up.

#### Subject: Friday, July 11, 08:00 am (Thursday, July 10, events)

#### Kevin/John -

Express brought out new equipment and had it ready by about 9:15 this morning. We ran the ring gauge downhole through a lubricator immediately following a tailgate safety meeting. The gauge encountered soot and chalk fines at 3,972' bgs and could not be lowered further.

We received notification of NMOCD approval to set the mechanical bridge plug at 3,972' bgs, approximately 50' higher than the perforations, around 1:00 pm and began operations to set the plug.

The plug was set and a dump bailer used to drop 2 bailer-full loads of cement (totaling approximately 40') onto the bridge plug by around 3:00 pm. The top of cement will be tagged in the am after it has set. The Nabors crew chief left the location soon after to pick up a packer and more salt gel for tomorrow's operations. If the plug has held and the cement set on top of it, more cement will be added and salt gel will be pumped downhole in an attempt to circulate.

None of today's work was conducted under supplied air. Any time the blow out preventer was opened or the wireline tripped out of the hole Total Safety donned an SCBA and collected readings from valves to be opened. H2S was not detected during any of these events. CRA conducted spot checks of air quality on the pad throughout the day.

Although H2S was not encountered today, Total Safety will remain onsite until H2S has been sealed off.

#### Subject: Saturday, July 12, 08:00 am (Friday, July 11, events)

Upon reaching location this morning Total Safety donned an SCBA and cracked the valve on the blow out preventer to collect an air reading. The no H2S was detected and the following work was conducted without supplied air:

Nabors ran tubing to tag top of cement to check the integrity of the plug placed yesterday. Top of cement was encountered at 3,940' bgs.

70 bbls of salt gel was circulated through the well, then 24 sacks of class C cement was pumped to 3,625' bgs by 2:00 pm. As the cement would take 4 hours to set, and their services would not be required before shut down, Total Safety and Express left location at this time.

Nabors tagged top of cement and tripped tubing out of the well. Nabors and CRA were offsite at 6:30 pm.

#### Subject: Sunday, July 13, 08:00 am (Saturday, July 12, events)

Express ran in the hole with the wireline this morning and perforated at 2,150' bgs. Nabors ran in the hole with an AD1 packer to set at 1,685' bgs, but were unable to get it to set. Upon pulling out of the hole, found that the shear ring had sheared on the packer.

Nabors then attempted to circulate salt gel through the new perforations in the 4 ½ inch to the 8 5/8. A total of 25 bbls salt gel was pumped with circulation in the 8 5/8 to surface.

Nabors is locating another packer to run down hole in the A.M.

#### Subject: Tuesday, July 15, 08:00 am (Monday, July 14, events)

Nabors had a vacuum truck onsite by 9:30 to collect waste for the half frac. They also located a new packer and had it onsite by approximately 11:00 am. They rigged up and set the packer at 1,685' bgs, then pumped 110 sacks of cement into the well.

Express was onsite by 4:30 pm to perf, but a storm was rolling in with lightning visible. After waiting to see if it would blow over, work was called off around 6:00 pm due to lightning.

As no H2S has been detected for the last several days, Total Safety packed up and were offsite around 11:00.

The current plan for air monitoring consists of personal H2S badges and four gas meters at the wellhead and half frac.

Christine Mathews with CRA will take over for me for the rest of the week.

#### Subject: Wednesday, July 16, 08:00 am (Tuesday, July 15, events)

Work began at 0900. A tailgate safety meeting was held and JSA reviews completed for wireline operation and perfing. Express ran the wireline to tag top of plug set the previous day. Plug was verified at 1955'. They then pulled up to 1713' to perforate the casing. Once complete they pulled out of the hole.

Nabors then tripped in tubing in prep for placing another cement plug. Intended plug depth was to be from 1713' to 1500' with 110 sacks of class C.

A Nabors vacuum truck was on site to remove displaced well fluids from the half frac.

After the cement plug had been pumped and allowed to set for 4 hours Nabors tripped the tubing string from the well and Express went down hole to verify plug depth. Express tagged top of plug at 1050'. Nabors then verified that 130' sacks of cement were pumped rather than the anticipated 110. Express then pulled up to 420' and perforated the casing.

Express loaded up their equipment in prep to leave the site. CRA received copies of their ticket and correlation collar logs. Express was off site at 1650.

Nabors had to disassemble the pump head on the cement mixer to remove a dry plug. Once this was completed, 233 sacks of class C cement were pumped from 420' to ground surface.

The site was secured for the evening and CRA and Nabors were off site at 1925.

#### Subject: Wednesday, July 16, 6:33 pm (Wednesday, July 16, events)

Nabors and CRA arrived onsite at 0900. A tailgate safety meeting was held and Nabors JSA reviewed.

Nabors began to remove the BOP from the wellhead and checked to see if cement had settled from 7/15. Cement was tagged at 6' bgs. Nabors crew then began to rig down and get equipment, tanks, and trucks ready to leave the site.

Two Nabors vac trucks arrived on site around 0915. Reviewed JSAs. One vac truck removed displaced well fluids from the half frac, the other stood by until they could access the full frac of freshwater.

The first truck finished removal from the half frac, took a DOT break, and left the site at 1210. Half frac fluids where transported to Sundance in Eunice, NM for disposal. Second vac truck removed fresh water from full frac and was off site at 1215. Second truck was headed to the Nabors yard.

The drill crew continued to prepare equipment and site for demob. Rig was moved and staged at the muster point. The catwalk and anchor beam were moved to make room for digging and welding at the wellhead tomorrow.

A site sweep was done to pick up any loose equipment, tools, and trash.

CRA and Nabors were off site and headed to Roswell at 1310.

Nabors supervisor was to finalize and complete coordination of backhoe and welder for tomorrow's tasks. Also tomorrow, Nabors will provide copies of all daily tickets and JSAs.

Work will resume tomorrow at 0900.

Christine

#### Subject: Thursday, July 17, 6:33 pm events:

CRA and Nabors were on site at 0900. Nabors informed CRA that one of the trucks transporting either the backhoe or welding equipment had a flat tire and were running behind. Nabors opted to use the time to transport the rig and bulk dry cement truck from the muster point over to the highway.

1100 Nabors crew was back on site with RWI who provided the transport and operation of the backhoe. Tailgate safety meeting and JSA review was completed. The area around the wellhead was dug to 5' bgs. Crew stood by to wait for the welder.

Welder with RWI arrived on site at 1220. A JSA was prepared and reviewed as well as the tailgate safety topics. Well was checked with the 5 gas meter prior to initiation of cutting/welding activities. LEL at 0%, H2S at 0ppm, and VOCs at 19.2 ppm. VOCs were present likely due to the small amount of sludge/oil present on the casing near the surface where the reading was taken. Welding proceeded. The inner and outer casing strings were measured to 4' bgs and cutting began.

At 1330 the top of the casing had been removed and the name plate was made. The plate read:

Anadarko Booher 35 3 UH S35 T7S R31E API 3000520843 7•17•14

1405 Nabors truck arrives to load and haul the catwalk and anchor beam.

1430 the name plate had been completed and prep was done to get the casing and plate ready to be welded.

1440 the Nabors truck with loaded equipment left the site for the Nabors yard

By 1510 the name plate had been successfully welded to the top of the cut casing. Backhoe operator proceeded to fill in and pack the hole. This was completed by 1530. RWI prepares to demob from site. (Pictures attached)

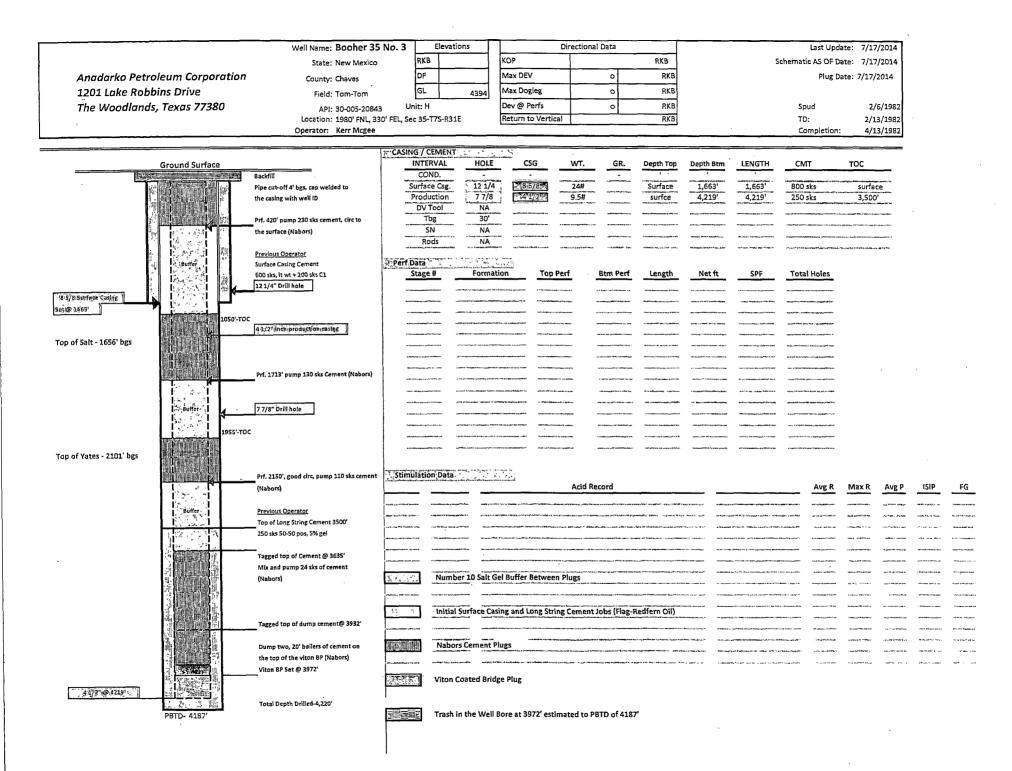

All Nabors, RWI, and CRA employees were off site at 1545.

Nabors and CRA will return to the site tomorrow at 0900 to remove the cement pump truck, tubing and pipe racks, half frac and full frac, dog house, and forklift.
