dell(s) will be connected to a production facility after flowback operations are complete, if gas transporter systemace. The gas produced from production facility is dedicated to western and will be connected in low/high pressure gathering system located in County, New Mexico. It will for pipeline to connect the facility to low/high pressure gathering system. Mewbourne Oil Company periodically) to western a drilling, completion and estimated first production date for wells that are scheded the foreseeable future. In addition, Mewbourne Oil Company and western have perference calls to discuss changes to drilling and completion schedules. Gas from these wells will be processing Plant located in Sec. 36, Blk. 58 T1S, culberson County, Texas. The action of the gas will be based on compression operating parameters and gathering system pressures.
lowback Strategy
fter the fracture treatment/completion operations, well(s) will be produced to temporary production tanks and gas
ared or vented. During flowback, the fluids and sand content will be monitored. When the produced fluids contain a
and, the wells will be turned to production facilities. Gas sales should start as soon as the wells start flowing thro roduction facilities, unless there are operational issues on <u>western</u> system at that time. Based on current inform
Operator's belief the system can take this gas upon completion of the well(s).
afety requirements during cleanout operations from the use of underbalanced air cleanout systems may necessite and non-pipeline quality gas be vented and/or flared rather than sold on a temporary basis.

Alternatives to Reduce Flaring

Below are alternatives considered from a conceptual standpoint to reduce the amount of gas flared.

- Power Generation On lease
 - o Only a portion of gas is consumed operating the generator, remainder of gas will be flared
- Compressed Natural Gas On lease
 - o Gas flared would be minimal, but might be uneconomical to operate when gas volume declines
- NGL Removal On lease
 - Plants are expensive, residue gas is still flared, and uneconomical to operate when gas volume declines
