1. The first step in the process of identifying a problem is to determine the scope of the problem. This involves identifying the specific area of concern and the individuals or groups affected by the problem. Once the scope of the problem is determined, the next step is to gather information about the problem. This can be done through a variety of methods, including interviews, surveys, and observation. The information gathered should be used to identify the causes of the problem and to determine the best course of action to take. Finally, the problem should be solved by implementing the chosen course of action and evaluating the results. This process is often iterative, meaning that it may be necessary to revise the chosen course of action as more information is gathered and the problem evolves.

1. The first step in the process of the investigation is to identify the problem. This is done by the investigator who is responsible for the investigation. The investigator will identify the problem and then will determine the scope of the investigation. The investigator will then determine the objectives of the investigation and will then determine the methods of the investigation. The investigator will then determine the results of the investigation and will then determine the conclusions of the investigation. The investigator will then determine the recommendations of the investigation and will then determine the actions of the investigation. The investigator will then determine the follow-up of the investigation and will then determine the final report of the investigation.

1. The first step in the process is to identify the problem or issue that needs to be addressed. This involves gathering information and understanding the context of the problem.

The amount of the released  $\text{H}_2\text{O}$  was measured by the weight difference of the hydrogel before and after the release. The concentration of the  $\text{H}_2\text{O}_2$  solution was 0.1, 0.2, 0.3, 0.4, 0.5, 0.6, 0.7, 0.8, 0.9, and 1.0 wt. %.

Phosphoril adenosin-5', 3'-bisphosphat (PAP) wurde durch Phosphorylierung von Adenosin-5'-phosphat (AP) mit Hilfe von ATPase (E. coli) in Gegenwart von MgCl<sub>2</sub> und KCl hergestellt. Die Reaktion wurde bei 37°C in 0,1 M Tris-HCl-Puffer (pH 7,4) durchgeführt. Die Reaktionsbedingungen waren: 10 mM ATP, 10 mM MgCl<sub>2</sub>, 10 mM KCl, 10 mM Tris-HCl (pH 7,4), 10 mM AP, 10 mM PAP. Die Reaktion wurde durch Zugabe von 10 mM EDTA gestoppt. Die Konzentrationen von PAP und AP wurden durch HPLC bestimmt.
