III. Well Data

- A. The following well data must be submitted for each injection well covered by this application. The data must be both in tabular and schematic form and shall include:
 - (1) Lease name: Well No.; Location by Section, Township and Range; and footage location within the section.

Operator: Mack Energy Corporation (OGRID # 013837) Lease/Well Name & Number: Rooster SWD #1 Legal Location: 1650 FNL & 1650 FWL – Unit F – Section 34 T14S R31E – Chaves County

Coordinates: 33.0622508, -103.8128126 (NAD 83)

(2) Each casing string used with its size, setting depth, sacks of cement used, hole size, top of cement, and how such top was determined.

Casing String	Hole Size (in)	Casing Size (in)	Casing Depth (ft)	Sacks Cmt (sx)	Top of Cmt (ft)	Method Determined
Surface	17 1/2	13 3/8	1,400'	925	0	Circulation
Intermediate	12 1/4	9 5/8	3,900'	1,125	0	Circulation
Production	8 3/4	7	13,700'	1,415	0	Circulation

3 Stage DV Tools @ 3800' & 12,700' on Production Casing string. Stage 1- Lead 50bbls Pro M Spacer, tail 135sx Class C. Stage 2-Lead 755sx Light Weight 2% P202, tail 200sx Pro-Eco. Stage 3-Lead 205sx Class C, tail 120sx Class C cement. A wellbore diagram is included in Attachment 1.

(3) A description of the tubing to be used including its size, lining material and setting

depth. 3 1/2" EUE IPC @ 11,855'

(4) The name, model, and setting depth of the packer used or a description of any other seal system or assembly used.

Arrow Set 10K Nickel Plated Packer w/ 2.31 R Profile Nipple @ 11,855'

- B. The following must be submitted for each injection well covered by this application. All items must be addressed for the initial well. Responses for additional wells need be shown only when different. Information shown on schematics need not be repeated.
 - (1) The name of the injection formation and, if applicable, the field or pool name. Injection Formation Name- Devonian Pool Name- SWD; Devonian Pool Code-96101
 - (2) The injection interval and whether it is perforated or open-hole. Perforated between 12,900-13,600'
 - (3) State if the well was drilled for injection or, if not, the original purpose of the well. New Drill for Injection

- (4) Give the depths of any other perforated intervals and details on the sacks of cement or bridge plugs used to seal off such perforations. None
- (5) Give the depth to and the name of the next higher and next lower oil or gas zone in the area of the well, if any.
 - Overlying Yates (2330') Seven Rivers (2545') Queen (3080') Grayburg (3455') San Andres (3775') Glorieta (5300') Tubb (6615') Abo (7390') Wolfcamp (8710') Underlying

Cisco (9590') Atoka (11,150') Miss (11,840') Woodford (12,835') Devonian (12,900')

Montoya (13,600')

<u>V. AOR Maps</u> Attach a map that identifies all wells and leases within two miles of any proposed injection well with a one-half mile radius circle drawn around each proposed injection well. This circle identifies the well's area of review.

The following figures are included in Attachment 2:

- 2-Mile Well Map
- 1-Mile Well Map
- 1-Mile AOR Well List
- 2-Mile Lease Map
- 1-Mile Surface Ownership Map
- 1-Mile Mineral Ownership Map

VI. AOR List

Attach a tabulation of data on all wells of public record within the area of review which penetrate the proposed injection zone. Such data shall include a description of each well type, construction, date drilled, location, depth, record of completion, and a schematic of any plugged well illustrating all plugging detail.

Details of the wells within the 1-mile AOR are included in Attachment 2.

VII. Operational Information

Attach data on the proposed operation, including:

(1) Proposed average and maximum daily rate and volume of fluids to be injected; Maximum: 20,000 bwpd

Average: 15,000 bwpd

- (2) Whether the system is open or closed; The system is closed.
- (3) Proposed average and maximum injection pressure; Maximum: 2,580 psi Average: 1,000 psi
- (4) Sources and an appropriate analysis of injection fluid and compatibility with the receiving formation if other than reinjected produced water; It is anticipated that produced water from San Andres production wells in the area will be injected into the proposed SWD. Therefore, water analyses from these formations was obtained and are included in Attachment 3.
- (5) If injection is for disposal purposes into a zone not productive of oil or gas at or within one mile of the proposed well, attach a chemical analysis of the disposal zone formation water (may be measured or inferred from existing literature, studies, nearby wells, etc.)

N/A- There is not a Devonian well in the area to get a sample. We can provide the sample during completion. We can perf and swab the well to provide a sample.

VIII. Geologic Description

Attach appropriate geologic data on the injection zone including appropriate lithologic detail, geologic name, thickness, and depth. Give the geologic name, and depth to bottom of all underground sources of drinking water (aquifers containing waters with total dissolved solids concentrations of 10,000 mg/l or less) overlying the proposed injection zone as well as any such sources known to be immediately underlying the injection interval.

The Rooster SWD #1 injected fluid will be contained within the Devonian Formation. Immediately above the Devonian, the Woodford Shale is low permeability and the Mississippian Lime Formation is low porosity and low permeability carbonate. The Woodford and Mississippian Lime Formations, which are combined 1060' thick, will be the upper seal and contain the Devonian injected fluid. Below the Devonian Formation is 100' of low porosity and low permeability carbonate in the Montoya Formation. The top 100' of the Montoya will be the bottom seal and contain the Devonian injected fluid.

- Lithologic Detail- Dolomite
- Geological Name- Devonian
- Thickness- 700'
- TD- 13,700'
- Injection Depth- 12,900-13,600' Perforated completion

The base of the lowermost Underground Source of Drinking Water (USDW), identified as the top of the first anhydrite, was determined to occur at the top of the Rustler formation at a depth of 1360'. Water wells in the area for domestic/livestock use are drilled to the depth of approximately 350' Southern High Plains Aquifer. Wells on POD are Shut-In and were unable to test fresh water.

A Seismic Risk Assessment is included in Attachment 4.

IX. Proposed Stimulation Program

Describe the proposed stimulation program, if any.

Treated with 10,000 gallons 15% acid.

X. Logging and Test Data

Attach appropriate logging and test data on the well. (If well logs have been filed with the Division, they need not be resubmitted).

Logs will be run and submitted to the Division once the well is completed.

XI. Groundwater Wells

Attach a chemical analysis of fresh water from two or more fresh water wells (if available and producing) within one mile of any injection or disposal well showing location of wells and dates samples were taken.

Attachment 5 includes a 1-mile Water Well Map. Wells on POD are Shut-In and were unable to test fresh water.

XII. No Hydrologic Connection Statement

Applicants for disposal wells must make an affirmative statement that they have examined available geologic and engineering data and find no evidence of open faults or any other hydrologic connection between the disposal zone and any underground sources of drinking water.

A signed affirmative statement is included in Attachment 6.

XIII. Proof of Notice

Applicants must complete the "Proof of Notice" section on the reverse side of this form. All applicants must furnish proof that a copy of the application has been furnished, by certified or registered mail, to the owner of the surface of the land on which the well is to be located and to each leasehold operator within one-half mile of the well location.

A copy of the application was mailed to the Affected Persons, including the OCD District Office, surface owner, leasehold operators within the AOR and BLM/SLO if they own minerals within the AOR. **Attachment 8** includes a list and letters of the Affected Persons receiving notice of the application and the associated certified mailing receipts.

Where an application is subject to administrative approval, a proof of publication must be submitted. Such proof shall consist of a copy of the legal advertisement which was published in the county in which the well is located.

A Public Notice was published in the Roswell Daily Record, a newspaper of general circulation in the area, and the associated affidavit is included in **Attachment 7**.

The Stage Mechanical DV tool is a device that provides a selective communication path inside the casing to the annulus. It contains an inner sleeve with a shifting profile operated by dropping a free fall device to seat. Once on seat pressure is applied, the sleeve shifts into the open position exposing ports to allow for stage cementing. A closing plug following the stage cement lands in the DV tool and closes the ports permanently. All components are PDC drillable. The Stage Mechanical DV Tool simple operation and reliability, combined with TAM's inflatable Casing Annulus Packer, make it the ideal choice stage cement jobs.

Mr. Phillip Goetze, P.G. NM EMNRD – Oil Conservation Division 1220 South St. Francis Drive Santa Fe, NM 87505

Subject: Mack Energy Corporation Rooster SWD #1 - Seismic Potential Letter

Dear Mr. Goetze,

At the request of Mack Energy Corporation (Mack Energy), ALL Consulting, LLC (ALL) has assessed the potential injection-induced seismicity risks in the vicinity of Mack Energy's Rooster SWD #1, a proposed saltwater disposal (SWD) facility in Chaves County, New Mexico, and summarized the findings in this letter. This assessment used publicly available data to identify the proximity and characteristics of seismic events and known faults to evaluate the potential for the operation of the Rooster SWD #1 to contribute to seismic activity in the area.

Geologic Evaluation

The Rooster SWD #1 is requesting a permit to inject into the Devonian Formation at a depth of 12,900-13,600 feet below ground surface (bgs). The Devonian Formation consists of cherty limestone and dolomites and is overlain by approximately 28 feet of low porosity and permeability Mississippian Lime, which would prevent the upward migration of injection fluid and serve as the upper confining layer (see **Attachment 1**). Additionally, the Devonian Formation is underlain by various low porosity and permeability zones within the Silurian and Montoya Groups, both of which consist of limestones, dolomites, and interbedded shale zones. No geophysical logs penetrating the Silurian and Montoya Groups were available within 10 miles of the Rooster SWD #1. A stratigraphic chart depicting the geologic setting is included as **Figure 1**.¹

Seismic Events and Fault Data

A review of United States Geological Survey (USGS) and New Mexico Tech Seismological Observatory (NMTSO) earthquake catalogues determined that four (4) seismic events have been recorded within a 100 square mile area [9.08-kilometer (km) radius] around the Rooster SWD

#1. The closest recorded seismic event was a M1.44 that occurred on May 16, 2021, and was located approximately 3.52 miles southeast of the Rooster SWD #1 (see **Attachment 2**).

Fault data from United States Geological Survey (USGS) and the Texas Bureau of Economic Geology (BEG)² indicates that the closest known fault is located approximately 7.13 miles southeast of the Rooster SWD #1 (see **Attachment 2**). This identified fault is within the Precambrian basement, which is approximately 2,400 feet below the proposed injection interval.³ A map of the seismic events and faults within 9.08 km of the Rooster SWD #1 is included as **Attachment 2**.

Seismic Potential Evaluation

Experience in evaluating induced seismic events indicates that most injection-induced seismicity throughout the U.S. (e.g., Oklahoma, Ohio, Texas, New Mexico, and Colorado) occurs as a result of injection into Precambrian basement rock, into overlying formations that are in hydraulic communication with the Precambrian basement rock, or as a result of injection near

Figure 1 – Delaware Basin Stratigraphic Chart (Adapted from Yang and Dorobek 1995)

critically stressed and optimally oriented faults. Seismicity at basement depths occurs because critically stressed faults generally originate in crystalline basement rock and may also extend into overlying sedimentary formations.⁴

Injection into either the Precambrian basement rock or its overlying formations that are hydraulically connected to the basement rock through faulting or fracture networks can increase the pore pressure and may lead to the fault slipping, resulting in a seismic event.⁴ As such, the vertical distance between the injection formation and Precambrian basement rock and the presence or lack of faulting within the injection interval are major considerations when determining the risk of injection-induced seismicity.

² Horne E. A. Hennings P. H., and Zahm C. K. 2021. Basement structure of the Delaware Basin, in The Geologic Basement of Texas: A Volume in Honor of Peter Flawn, Callahan O. A., and Eichubl P., The University of Texas at Austin, Bureau of Economic Geology.

³ G. Randy Keller, J. M. Hills &; Rabah Djeddi, A regional geological and geophysical study of the Delaware Basin, New Mexico and West Texas, Trans Pecos Region (West Texas) (1980).

⁴ Ground Water Protection Council and Interstate Oil and Gas Compact Commission.

Potential Injection-Induced Seismicity Associated with Oil & Gas Development: A Primer on Technical and

Regulatory Considerations Informing Risk Management and Mitigation. 2015. 141 pages.

Geophysical data from nearby well records, aeromagnetic surveys, and gravity surveys indicates the top of the Precambrian basement to be approximately 16,000 feet bgs at the Rooster SWD #1, or approximately 2,400 feet below the proposed injection interval.³ In addition, publicly available fault data does not indicate any transmissive faulting is present above the Precambrian basement around the Rooster SWD #1.

Class II SWDs in New Mexico are permitted with a maximum pressure gradient of 0.2 psi/ft. Review of New Mexico Oil Conservation Division (OCD) Order IP-537 from the Mack Energy Round Tank SWD #1, which is located approximately 15.5 miles southwest of the Rooster SWD #1, determined the maximum allowable surface pressure for a Devonian SWD in the region is 0.41 psi/ft from an approved step-rate test. Typical SWD permitting standards in New Mexico would indicate that formation parting pressure would not be exceeded by the Rooster SWD #1.

Conclusion

As an expert on the issue of induced seismicity, seismic monitoring, and mitigation, it is my opinion that the potential for the Rooster SWD #1 to cause injection-induced seismicity is expected to be minimal, at best. This conclusion assumes the Rooster SWD #1 will be operated at or under the maximum allowable surface injection pressure based on the regulatory requirement of 0.2 psi/ft and is based on (1) the presence of numerous confining layers above and below the injection interval, (2) the significant vertical distance between the injection zone and Precambrian basement rock in which the nearest fault has been identified, and (3) the lack of mapped faults in the vicinity of the Rooster SWD #1.

Sincerely, ALL Consulting

Reed Davis Geophysicist

XII. AFFIRMATIVE STATEMENT

RE: Rooster SWD #1

We have examined the available geologic and engineering data and find no evidence of open faults or any other hydraulic connection between the disposal zone and any underground source of drinking water.

Mack Energy Corporation

Date: 4/9/2024

Charles Sadler, Geologist

Public Notice ...

Publish July 14, 2024

Mack Energy Corporation, Post Office Box 960, Artesia, NM 88211-0960, has filed an Application with the New Mexico Oil Conservation Division seeking authorization to inject produced water into the Rooster SWD #1 1650 FNL 1650 FWL of Section 34, T14S, R31E, NMPM, Chaves County, New Mexico. The water will be injected into the Devonian at a disposal depth of 12,900-13,600'. Water will be injected at a maximum surface pressure of 2,580# and a maximum injection rate of 15,000-20,000 BWPD. Any interest party with questions or comments may contact Deana Weaver at Mack Energy Corporation, Post Office Box 960, Artesia, NM 88211-0960 or call 575-748-1288. Objections to this application or requests for hearing must be filed with the Oil Conservation Division, 1220 South Saint Francis Drive, Santa Fe, New Mexico 87505, within fifteen days of the date of publication of this notice. To all Interest Owners:

Enclosed for your review is a copy of Mack Energy Corporation's application for a Devonian SWD well. Produced water will be injected at a proposed depth of 12,900-13,600'. The Rooster SWD #1 located 1650 FNL & 1650 FWL, Sec. 34 T14S R31E, Chaves County.

The letter will serve as a notice that Mack Energy Corporation has requested administrative approval from the NMOCD to drill this well as a water disposal. If you have any objections, you must notify the Oil Conservation Division in Santa Fe in writing at 1220 South St. Francis Drive, Santa Fe, NM 87505 within fifteen (15) days of receiving this letter.

Sincerely,

Mack Energy Corporation

Via Certified Mail 9589 0710 5270 0175 5638 57 Return Receipt Requested

EGO Resources INC 1111 Bagby St. Sky Lobby 2 Houston, TX 77002

To all Interest Owners:

Enclosed for your review is a copy of Mack Energy Corporation's application for a Devonian SWD well. Produced water will be injected at a proposed depth of 12,900-13,600'. The Rooster SWD #1 located 1650 FNL & 1650 FWL, Sec. 34 T14S R31E, Chaves County.

The letter will serve as a notice that Mack Energy Corporation has requested administrative approval from the NMOCD to drill this well as a water disposal. If you have any objections, you must notify the Oil Conservation Division in Santa Fe in writing at 1220 South St. Francis Drive, Santa Fe, NM 87505 within fifteen (15) days of receiving this letter.

Sincerely,

Mack Energy Corporation
