Mike, et al.,

Good morning!

Based on your responses below, my comment is that the key PSP Sampling objective of OCD is to evaluate the EPA RCRA Hazardous Parameters in effluent. While I understand your comment on pesticides, OCD is aware that crude oil can contain many constituents, including insecticides, some constituents of which have yet to be identified due to laboratory interferences, capabilities, etc., I recommend that they be included and evaluated for the PSP so we can conclude our evaluation. Since the laboratories provide complete scans, this wouldn't seem to be more than a reporting issue for the lab. Isn't this correct? I can confirm with our QAPP Lab (Hall Environmental).

Thank you.

**Subject:** [EXTERNAL] OCD Upload for RDU Injection

HFNR is probably planning to schedule around the next quarterly sampling event or around the discharge permit quarterly sampling schedule? A PSP schedule for implementation would be good. We will be planning to sample independent of the 1/4ly sampling although if they overlap that works too. Mainly we are trying to get scheduled around RDU start-up – which is still April 30 but we'll be checking to make sure as these things tend to drag out.

Also, I double-checked the PSP sampling list and don't see: Lindane; Methoxychlor; and Toxaphene; 2,4,5-TP (Silvex). These hazardous toxicity parameters need to be added for the PSP sampling. These are pesticides that we don't have in the permit for TCLP testing as the refinery neither uses in the process or produces. During permit renewal discussions in 2014 we left these out for that reason and would still recommend not including. Chlordane somehow is still in there even though we discussed it should come out. See attached correspondence related to this issue.

Under PSP Reporting, OCD would like to receive a PSP Sampling Status Report at the conclusion of the 4-Weeks of Post RDU (30-days?) with a description of any anomalies or exceedances of sampling criteria. At the end of a year, a summary could be provided in the annual report with any recommendations based on the one-year of quarterly observations. That works but I think it may take a bit to pull everything together since we'll have the last analytical from the final week lagging. So not on day 30 – can we say Day 60 just to have time to do stats, etc.? That still equates to the 4 weeks we mentioned in the PSP (4 weeks after final results).

My recommendation to Phil on receiving revisions is that we are good to go with all of our additional correspondences on the PSP in writing (e-mail).

Phil's call on a communication meeting.

Thank you.

**Subject:** [EXTERNAL] OCD Upload for RDU Injection

Thanks Carl! You are correct, for the pre-RDU sampling consisting only of the cooling tower blowdown (since no TCLP data exist at this location), a total of three weekly samples was chosen to give a proper estimate of CTB baseline conditions. Three being the number we need for statistics. Also, you are correct that for post-RDU sampling, both the CTB and WWTP effluent will be collected concurrently.

Would you like us to revise anything in the PSP to be consistent w/the discussion below?

Thanks for all your help!

Mike

Mike, et al.,

Good morning!

OCD has reviewed the response and concurs with the communication below from HollyFrontier Navajo Refining, LLC (HFNR).

The only clarification that I have is on the Pre-RDU sampling. Is the Pre-RDU sampling consistent with the Post-RDU sampling, i.e., weekly (4-weeks) before Post-RDU sampling begins and then concurrently with Post-RDU sampling?

Thank you.

Carl/Phil – thanks for your comments! Below we've provided a response to the items you had

included in your transmission to us. Please review and we can set a time to discuss – let me know if later this week works for y'all.

Thanks,  
Mike

**Comment #1** - *The permittee is planning to sample for current permit parameters and this does not address OCD's concerns about Hazardous Toxicity Characteristics Parameters (see attachment). I am confused by sole mention of hazardous characteristics testing (i.e., ignitability, reactivity & corrosivity) and permit listed constituents. OCD is attempting to make sure disposed effluent total concentrations are not RCRA hazardous as per 40 CFR 261.24 Table 1.*

**Response #1** – The current UICI-8 Permit requires quarterly monitoring for all parameters listed in 40 CFR 261.24 Table 1 except for 7 pesticides: D012, D013, D014, D015, D016, D017, and D031. As discussed between HFNR and the OCD during the 2014 UIC permit renewal process, there is no reason to include pesticides in the monitoring program as the refinery does not use or manufacture these substances. The addition of the RDU does not change this premise as this operation also does not use or manufacture pesticides and pesticides are not expected to be in the effluent. Therefore the list of toxicity parameters provided in Attachment 4 of the PSP (which reproduces the monitoring list contained in Section 2.A of the four well permits) will provide data that can be directly compared to the historical quarterly monitoring to assess any potential effects of the RDU on effluent quality, including whether the effluent exhibits a hazardous characteristic. As also indicated at the bottom of Attachment 4, ignitability, corrosivity, and reactivity (ICR) are measured quarterly in the laboratory in accordance with 40 CFR 261 as follows:

- Ignitability (D001) – Flashpoint (Method D93/1010A) – per 40 CFR 261.21(a)(1)
- Corrosivity (D002) – pH (Method 9040C) – per 40 CFR 261.22(a)(1)
- Reactivity (D003) – Reactive cyanide (Method 4500 CN E-2016) and reactive sulfide (Method 4500 S2 D-2011) – per 40 CFR 261.23(a)(5)

The above methodologies will be used for the PSP to be consistent with historical quarterly monitoring.

**Comment #2** - *The permittee shall ensure that all samples are collected around the same time and exactly 1-week apart in order to generate accurate effluent quality measurements. There is nebulous language on possible variations between weekly sampling that may result in a longer than a 1-month sampling period. The operator shall ensure that all samples are collected around the same time and exactly 1-week apart in order to generate accurate effluent quality measurements.*

**Response #2** – Per the OCD request, Navajo will modify the PSP to consistently collect representative weekly samples on the same day of the week and at the same time of the day. However, if the day/time must be slightly altered due to weather, safety, or operational (e.g., upset conditions that prevent discharge) issues, Navajo will notify OCD at the time of sampling and when submitting the corresponding lab report (see Comment #3 below).

**Comment #3** - *The permittee shall complete expedited discrete evaluation of each weekly environmental analytical laboratory data results and forward data results and a review of any exceedances identified to the OCD. This means the lab turn-around of samples must be expedited. There are only 2-sample locations. The permittee shall be prepared for any corrective actions from the OCD including shut-down.*

**Response #3** – Per the OCD request, Navajo will expedite lab results. According to Hall Environmental Analysis Laboratory (contractor), the standard turnaround time for the quarterly UIC sampling is 10 days, but this can be expedited to about 5 days. Each of the four weekly post-RDU sample results will be submitted individually to OCD upon Navajo receipt/review from the lab to facilitate dialog for any potential actions/corrections. As detailed in the PSP, after the last sample event, a summary report will be prepared and include full pre- and post-RDU comparisons (including the use of UCL 95% baseline calculations and other statistical methods, as appropriate based on the data set) as well as evaluation against TCLP and ICR regulatory criteria. After the PSP has been completed, Navajo will continue the permitted quarterly sampling program, including assessment for one year of any changes over PSP baseline levels.

For clarification, the pre-RDU sampling of cooling tower blowdown (only) will occur 1/week for three weeks prior to RDU operations and will be subject to the expedited lab turnaround time. Further, no weekly pre-RDU sampling for the WWTP effluent to the wells is planned or necessary due to the existence of the historical quarterly database.

***Comment #4** - OCD Post- RDU sampling is interested in non-filtered” or totals effluent samples. While OCD WQCC Regs require “filtered” groundwater samples to assess the presence of dissolved contaminants for remedial characterization, OCD is concerned with “unfiltered” or total concentration for purposes of injection into an injection well. There is a difference and the permittee shall do both unfiltered and filtered effluent sampling for the Post-RDU weekly sampling to compare with Attachment 2 injection well results which appear to be filtered. Also, the Permittee should have the laboratory filter in lab as opposed to in-field filtering.*

**Response #4** – Navajo concurs with OCD that sampling for constituents as totals should be the principal focus of effluent sampling, consistent with historical quarterly sampling, and that it is not necessary to analyze dissolved fractions. In Attachment 2, the third bullet on the top of page 2 states: “One sample is labeled to be filtered (use the filter provided in the ice chest)”. This refers only to the sample bottle for the cation parameters of calcium, magnesium, potassium, and sodium (all non-TCLP). Field filtration of these samples is necessary for the lab to properly generate the cation/anion balance required under Section 2.A of the UICI-8 Permit. No other parameters besides these four cations are (or will be) filtered; this methodology will be carried forward in the PSP for consistent historical comparison. Navajo will revise the text to Attachment 2 to clarify that the only dissolved fraction sampling (i.e., field filtering) occurs for the cations mentioned above.

***Comment #5** - The permittee shall follow EPA QA/QC and DQOs for the sampling and environmental analytical laboratory requirements where the prescribed sampling deviates from EPA Standard Methods.*

**Response #5** – Noted. No deviations from EPA Standard Methods are anticipated.

**Subject:** [EXTERNAL] OCD Upload for RDU Injection

Carl/Phil – thanks for your comments! Below we've provided a response to the items you had included in your transmission to us. Please review and we can set a time to discuss – let me know if later this week works for y'all.

Thanks,  
Mike

**Comment #1** - *The permittee is planning to sample for current permit parameters and this does not address OCD's concerns about Hazardous Toxicity Characteristics Parameters (see attachment). I am confused by sole mention of hazardous characteristics testing (i.e., ignitability, reactivity & corrosivity) and permit listed constituents. OCD is attempting to make sure disposed effluent total concentrations are not RCRA hazardous as per 40 CFR 261.24 Table 1.*

**Response #1** – The current UICI-8 Permit requires quarterly monitoring for all parameters listed in 40 CFR 261.24 Table 1 except for 7 pesticides: D012, D013, D014, D015, D016, D017, and D031. As discussed between HFNR and the OCD during the 2014 UIC permit renewal process, there is no reason to include pesticides in the monitoring program as the refinery does not use or manufacture these substances. The addition of the RDU does not change this premise as this operation also does not use or manufacture pesticides and pesticides are not expected to be in the effluent. Therefore the list of toxicity parameters provided in Attachment 4 of the PSP (which reproduces the monitoring list contained in Section 2.A of the four well permits) will provide data that can be directly compared to the historical quarterly monitoring to assess any potential effects of the RDU on effluent quality, including whether the effluent exhibits a hazardous characteristic. As also indicated at the bottom of Attachment 4, ignitability, corrosivity, and reactivity (ICR) are measured quarterly in the laboratory in accordance with 40 CFR 261 as follows:

- Ignitability (D001) – Flashpoint (Method D93/1010A) – per 40 CFR 261.21(a)(1)
- Corrosivity (D002) – pH (Method 9040C) – per 40 CFR 261.22(a)(1)
- Reactivity (D003) – Reactive cyanide (Method 4500 CN E-2016) and reactive sulfide (Method 4500 S2 D-2011) – per 40 CFR 261.23(a)(5)

The above methodologies will be used for the PSP to be consistent with historical quarterly monitoring.

**Comment #2** - *The permittee shall ensure that all samples are collected around the same time and exactly 1-week apart in order to generate accurate effluent quality measurements. There is nebulous language on possible variations between weekly sampling that may result in a longer than a 1-month sampling period. The operator shall ensure that all samples are collected around the same time and exactly 1-week apart in order to generate accurate effluent quality measurements.*

**Response #2** – Per the OCD request, Navajo will modify the PSP to consistently collect representative weekly samples on the same day of the week and at the same time of the day. However, if the day/time must be slightly altered due to weather, safety, or operational (e.g., upset conditions that prevent discharge) issues, Navajo will notify OCD at the time of sampling and when submitting the corresponding lab report (see Comment #3 below).

**Comment #3** - *The permittee shall complete expedited discrete evaluation of each weekly environmental analytical laboratory data results and forward data results and a review of any*

*exceedances identified to the OCD. This means the lab turn-around of samples must be expedited. There are only 2-sample locations. The permittee shall be prepared for any corrective actions from the OCD including shut-down.*

**Response #3** – Per the OCD request, Navajo will expedite lab results. According to Hall Environmental Analysis Laboratory (contractor), the standard turnaround time for the quarterly UIC sampling is 10 days, but this can be expedited to about 5 days. Each of the four weekly post-RDU sample results will be submitted individually to OCD upon Navajo receipt/review from the lab to facilitate dialog for any potential actions/corrections. As detailed in the PSP, after the last sample event, a summary report will be prepared and include full pre- and post-RDU comparisons (including the use of UCL 95% baseline calculations and other statistical methods, as appropriate based on the data set) as well as evaluation against TCLP and ICR regulatory criteria. After the PSP has been completed, Navajo will continue the permitted quarterly sampling program, including assessment for one year of any changes over PSP baseline levels.

For clarification, the pre-RDU sampling of cooling tower blowdown (only) will occur 1/week for three weeks prior to RDU operations and will be subject to the expedited lab turnaround time. Further, no weekly pre-RDU sampling for the WWTP effluent to the wells is planned or necessary due to the existence of the historical quarterly database.

***Comment #4** - OCD Post- RDU sampling is interested in non-filtered” or totals effluent samples. While OCD WQCC Regs require “filtered” groundwater samples to assess the presence of dissolved contaminants for remedial characterization, OCD is concerned with “unfiltered” or total concentration for purposes of injection into an injection well. There is a difference and the permittee shall do both unfiltered and filtered effluent sampling for the Post-RDU weekly sampling to compare with Attachment 2 injection well results which appear to be filtered. Also, the Permittee should have the laboratory filter in lab as opposed to in-field filtering.*

**Response #4** – Navajo concurs with OCD that sampling for constituents as totals should be the principal focus of effluent sampling, consistent with historical quarterly sampling, and that it is not necessary to analyze dissolved fractions. In Attachment 2, the third bullet on the top of page 2 states: “One sample is labeled to be filtered (use the filter provided in the ice chest)”. This refers only to the sample bottle for the cation parameters of calcium, magnesium, potassium, and sodium (all non-TCLP). Field filtration of these samples is necessary for the lab to properly generate the cation/anion balance required under Section 2.A of the UICI-8 Permit. No other parameters besides these four cations are (or will be) filtered; this methodology will be carried forward in the PSP for consistent historical comparison. Navajo will revise the text to Attachment 2 to clarify that the only dissolved fraction sampling (i.e., field filtering) occurs for the cations mentioned above.

***Comment #5** - The permittee shall follow EPA QA/QC and DQOs for the sampling and environmental analytical laboratory requirements where the prescribed sampling deviates from EPA Standard Methods.*

**Response #5** – Noted. No deviations from EPA Standard Methods are anticipated.

Carl/Phil – thanks for your comments! Below we’ve provided a response to the items you had included in your transmission to us. Please review and we can set a time to discuss – let me know if later this week works for y’all.

Thanks,  
Mike

**Comment #1** - *The permittee is planning to sample for current permit parameters and this does not address OCD’s concerns about Hazardous Toxicity Characteristics Parameters (see attachment). I am confused by sole mention of hazardous characteristics testing (i.e., ignitability, reactivity & corrosivity) and permit listed constituents. OCD is attempting to make sure disposed effluent total concentrations are not RCRA hazardous as per 40 CFR 261.24 Table 1.*

**Response #1** – The current UICI-8 Permit requires quarterly monitoring for all parameters listed in 40 CFR 261.24 Table 1 except for 7 pesticides: D012, D013, D014, D015, D016, D017, and D031. As discussed between HFNR and the OCD during the 2014 UIC permit renewal process, there is no reason to include pesticides in the monitoring program as the refinery does not use or manufacture these substances. The addition of the RDU does not change this premise as this operation also does not use or manufacture pesticides and pesticides are not expected to be in the effluent. Therefore the list of toxicity parameters provided in Attachment 4 of the PSP (which reproduces the monitoring list contained in Section 2.A of the four well permits) will provide data that can be directly compared to the historical quarterly monitoring to assess any potential effects of the RDU on effluent quality, including whether the effluent exhibits a hazardous characteristic. As also indicated at the bottom of Attachment 4, ignitability, corrosivity, and reactivity (ICR) are measured quarterly in the laboratory in accordance with 40 CFR 261 as follows:

- Ignitability (D001) – Flashpoint (Method D93/1010A) – per 40 CFR 261.21(a)(1)
- Corrosivity (D002) – pH (Method 9040C) – per 40 CFR 261.22(a)(1)
- Reactivity (D003) – Reactive cyanide (Method 4500 CN E-2016) and reactive sulfide (Method 4500 S2 D-2011) – per 40 CFR 261.23(a)(5)

The above methodologies will be used for the PSP to be consistent with historical quarterly monitoring.

**Comment #2** - *The permittee shall ensure that all samples are collected around the same time and exactly 1-week apart in order to generate accurate effluent quality measurements. There is nebulous language on possible variations between weekly sampling that may result in a longer than a 1-month sampling period. The operator shall ensure that all samples are collected around the same time and exactly 1-week apart in order to generate accurate effluent quality measurements.*

**Response #2** – Per the OCD request, Navajo will modify the PSP to consistently collect representative weekly samples on the same day of the week and at the same time of the day. However, if the day/time must be slightly altered due to weather, safety, or operational (e.g., upset conditions that prevent discharge) issues, Navajo will notify OCD at the time of sampling and when

submitting the corresponding lab report (see Comment #3 below).

**Comment #3** - *The permittee shall complete expedited discrete evaluation of each weekly environmental analytical laboratory data results and forward data results and a review of any exceedances identified to the OCD. This means the lab turn-around of samples must be expedited. There are only 2-sample locations. The permittee shall be prepared for any corrective actions from the OCD including shut-down.*

**Response #3** – Per the OCD request, Navajo will expedite lab results. According to Hall Environmental Analysis Laboratory (contractor), the standard turnaround time for the quarterly UIC sampling is 10 days, but this can be expedited to about 5 days. Each of the four weekly post-RDU sample results will be submitted individually to OCD upon Navajo receipt/review from the lab to facilitate dialog for any potential actions/corrections. As detailed in the PSP, after the last sample event, a summary report will be prepared and include full pre- and post-RDU comparisons (including the use of UCL 95% baseline calculations and other statistical methods, as appropriate based on the data set) as well as evaluation against TCLP and ICR regulatory criteria. After the PSP has been completed, Navajo will continue the permitted quarterly sampling program, including assessment for one year of any changes over PSP baseline levels.

For clarification, the pre-RDU sampling of cooling tower blowdown (only) will occur 1/week for three weeks prior to RDU operations and will be subject to the expedited lab turnaround time. Further, no weekly pre-RDU sampling for the WWTP effluent to the wells is planned or necessary due to the existence of the historical quarterly database.

**Comment #4** - *OCD Post- RDU sampling is interested in non-filtered” or totals effluent samples. While OCD WQCC Regs require “filtered” groundwater samples to assess the presence of dissolved contaminants for remedial characterization, OCD is concerned with “unfiltered” or total concentration for purposes of injection into an injection well. There is a difference and the permittee shall do both unfiltered and filtered effluent sampling for the Post-RDU weekly sampling to compare with Attachment 2 injection well results which appear to be filtered. Also, the Permittee should have the laboratory filter in lab as opposed to in-field filtering.*

**Response #4** – Navajo concurs with OCD that sampling for constituents as totals should be the principal focus of effluent sampling, consistent with historical quarterly sampling, and that it is not necessary to analyze dissolved fractions. In Attachment 2, the third bullet on the top of page 2 states: “One sample is labeled to be filtered (use the filter provided in the ice chest)”. This refers only to the sample bottle for the cation parameters of calcium, magnesium, potassium, and sodium (all non-TCLP). **Subject:** RE: Post-RDU Pilot Sampling Plan (PSP): Review Comments for Meeting w HollyFrontier  
**Date:** Tuesday, February 8, 2022 8:42:00 AM

---

Phil,

So, my final recommendation is:

1. Focus on Pre-RDU and Post-RDU sampling
2. Sample for Hazardous Characteristics (i.e., ignitability, reactivity & corrosivity) and Haz. Tox. Characteristics Parameters for RCRA Haz. Assessment
3. Focus on evaluating pre and post against each other for any changes, etc. related to solely hazardous evaluation
4. Complete UCL 95% Statistical Baseline of historical quarterly monitoring data (we have it)
5. Continue with quarterly permit sampling regime and evaluate any changes over a year of quarterly monitoring against the baseline.

This will significantly reduce the burden on the operator while focusing on OCD's concern with RCRA Haz. disposal conditions.

Thanks.

**Subject:** RE: Post-RDU Pilot Sampling Plan (PSP): Review Comments for Meeting w HollyFrontier

Phil,

I see the logic of also sampling for the permit constituents and for characteristically hazardous in samples as well including the post-RDU samples. I okay with their logic there.

Since they are going to also perform some weekly pre-RDU start-up, it would be good for them to sample the wastewater effluent going to the injection wells for the parameters mentioned to evaluate RCRA Hazardous Conditions before and post-RDU start-up.

For metals, total unfiltered is what I'm interested in knowing because we are not filtering to evaluate

contaminant hydrogeology here. We are assessing the effluent. I noticed that they are planning to filter samples in the field. This presents problems of its own for our purposes. I would let the lab do the filtering of any filtered metals. They should have the option to do both filtered and unfiltered.

Thank you.

**Subject:** Post-RDU Pilot Sampling Plan (PSP): Review Comments for Meeting w HollyFrontier

Phil,

Please find below my review comments on the HollyFrontier submittal dated 1/28/22 and received on 2/3/22 via E-Permitting.

My review comments on the RDU Pilot Sampling Plan (PSP) are:

1. The permittee is planning to sample for current permit parameters and this does not address OCD's concerns about Hazardous Toxicity Characteristics Parameters (see attachment). I am confused by sole mention of hazardous characteristics testing (i.e., ignitability, reactivity & corrosivity) and permit listed constituents. OCD is attempting to make sure disposed effluent total concentrations are not RCRA hazardous as per 40 CFR 261.24 Table 1.
2. The permittee shall ensure that all samples are collected around the same time and exactly 1-week apart in order to generate accurate effluent quality measurements. There is nebulous language on possible variations between weekly sampling that may result in a longer than a 1-month sampling period. The operator shall ensure that all samples are collected around the same time and exactly 1-week apart in order to generate accurate effluent quality measurements.

Pg. 6. Sample Frequency and Duration

Once the RDU is online and corresponding operations are normal and representative, samples for the WWTP effluent and CTB will each be collected once per week for a month; for a total of four sampling events. Individual sample events may be collected during

different days of the week and scheduling will be subject to facility operations and any weather conditions that might effect sample personnel safety. If sample events are delayed, the program will extend past one month until four events occur.

3. The permittee shall complete expedited discrete evaluation of each weekly environmental analytical laboratory data results and forward data results and a review of any exceedances identified to the OCD. This means the lab turn-around of samples must be expedited. There are only 2-sample locations. The permittee shall be prepared for any corrective actions from the OCD including shut-down.

Pg. 7: PSP Reporting Appendix A:

Division (OCD) within four weeks of receipt of the lab report for the final (fourth) sampling event. Based on this report, it is anticipated that OCD and Navajo will together make a determination as to whether further sampling may be warranted and/or if any other changes/revisions to the current Discharge Permit UICI-8 are necessary during permit renewal in 2022. If during the PSP program no impacts from RDU operations are observed on the discharge to the UIC wells, quarterly monitoring will resume in accordance with the current UICI-8 Discharge Permit.

4. OCD Post- RDU sampling is interested in non-filtered” or totals effluent samples. While OCD WQCC Regs. required “filtered” groundwater samples to assess the presence of dissolved contaminants for remedial characterization, OCD is concerned with “unfiltered” or total concentration for purposes of injection into an injection well. There is a difference and the permittee shall do both unfiltered and filtered effluent sampling for the Post-RDU weekly sampling to compare with Attachment 2 injection well results which appear to be filtered. Also, the Permittee should have the laboratory filter in lab as opposed to in-field filtering.

Page 12. Attachment 3:

CTB Sample Collection Procedure

5. The permittee shall follow EPA QA/QC and DQOs for the sampling and environmental analytical laboratory requirements where the prescribed sampling deviates from EPA Standard Methods.

Thank you.

Phil,

I see the logic of also sampling for the permit constituents and for characteristically hazardous in samples as well including the post-RDU samples. I okay with their logic there.

Since they are going to also perform some weekly pre-RDU start-up, it would be good for them to sample the wastewater effluent going to the injection wells for the parameters mentioned to evaluate RCRA Hazardous Conditions before and post-RDU start-up.

For metals, total unfiltered is what I'm interested in knowing because we are not filtering to evaluate contaminant hydrogeology here. We are assessing the effluent. I noticed that they are planning to filter samples in the field. This presents problems of its own for our purposes. I would let the lab do the filtering of any filtered metals. They should have the option to do both filtered and unfiltered.

Thank you.

**Subject:** Post-RDU Pilot Sampling Plan (PSP): Review Comments for Meeting w HollyFrontier

Phil,

Please find below my review comments on the HollyFrontier submittal dated 1/28/22 and received on 2/3/22 via E-Permitting.

My review comments on the RDU Pilot Sampling Plan (PSP) are:

1. The permittee is planning to sample for current permit parameters and this does not address OCD's concerns about Hazardous Toxicity Characteristics Parameters (see attachment). I am confused by sole mention of hazardous characteristics testing (i.e., ignitability, reactivity & corrosivity) and permit listed constituents. OCD is attempting to make sure disposed effluent

total concentrations are not RCRA hazardous as per 40 CFR 261.24 Table 1.

2. The permittee shall ensure that all samples are collected around the same time and exactly 1-week apart in order to generate accurate effluent quality measurements. There is nebulous language on possible variations between weekly sampling that may result in a longer than a 1-month sampling period. The operator shall ensure that all samples are collected around the same time and exactly 1-week apart in order to generate accurate effluent quality measurements.

Pg. 6. Sample Frequency and Duration

Once the RDU is online and corresponding operations are normal and representative, samples for the WWTP effluent and CTB will each be collected once per week for a month; for a total of four sampling events. Individual sample events may be collected during different days of the week and scheduling will be subject to facility operations and any weather conditions that might effect sample personnel safety. If sample events are delayed, the program will extend past one month until four events occur.

3. The permittee shall complete expedited discrete evaluation of each weekly environmental analytical laboratory data results and forward data results and a review of any exceedances identified to the OCD. This means the lab turn-around of samples must be expedited. There are only 2-sample locations. The permittee shall be prepared for any corrective actions from the OCD including shut-down.

Pg. 7: PSP Reporting Appendix A:

Division (OCD) within four weeks of receipt of the lab report for the final (fourth) sampling event. Based on this report, it is anticipated that OCD and Navajo will together make a determination as to whether further sampling may be warranted and/or if any other changes/revisions to the current Discharge Permit UICI-8 are necessary during permit renewal in 2022. If during the PSP program no impacts from RDU operations are observed on the discharge to the UIC wells, quarterly monitoring will resume in accordance with the current UICI-8 Discharge Permit.

4. OCD Post- RDU sampling is interested in non-filtered” or totals effluent samples. ## § 261.24 Toxicity characteristic.

(a) A solid waste (except manufactured gas plant waste) exhibits the characteristic of toxicity if, using the Toxicity Characteristic Leaching Procedure, test Method 1311 in “Test Methods for Evaluating Solid Waste, Physical/Chemical Methods,” EPA Publication SW-846, as incorporated by reference in [§ 260.11 of this chapter](#), the extract from a representative sample of the waste contains any of the contaminants listed in table 1 at the concentration equal to or greater than the respective value given in that table. Where the waste contains less than 0.5 percent filterable solids, the waste itself, after filtering using the methodology outlined in Method 1311, is considered to be the extract for the purpose of this section.

(b) A solid waste that exhibits the characteristic of toxicity has the EPA Hazardous Waste Number specified in Table 1 which corresponds to the toxic contaminant causing it to be hazardous.

Table 1 - Maximum Concentration of Contaminants for the Toxicity Characteristic

### **ATTACHMENT 3 – Cooling Tower Blowdown (CTB) Sample Collection Procedure**

#### **Purpose**

This procedure is for sampling events for wastewater discharged from the Artesia facility to the City of Artesia POTW, which includes discharges from the onsite wastewater treatment plant (WWTP) and cooling tower blowdown (CTB) streams from Y-1, Y-2, Y-11, Y-12, and Y-26 (post-RDU).

#### **Scope and Application**

This guideline applies to all HollyFrontier Navajo Refining LLC (Navajo or HFNR) employees, contractors and visitors.

The sampling is located at the sample station near the Artesia WWTP Effluent Outfall to the POTW, downstream of the confluence of the cooling tower blowdown (CTB from Y-1, Y-2, Y-11, Y-12, and Y-26) and Walnut Shell Filter (WWTP) effluent (see map below). For CTB sampling, the WWTP effluent will be blocked (i.e., diverted) to the injection wells so that the resulting discharge to the POTW only consists of CTB.

#### **Reference Document**

This procedure has been prepared in accordance with the US EPA guidance document on wastewater sampling: [https://www.epa.gov/sites/production/files/2017-07/documents/wastewater\\_sampling306\\_af.r4.pdf](https://www.epa.gov/sites/production/files/2017-07/documents/wastewater_sampling306_af.r4.pdf)

Albuquerque, New Mexico 87113

RE: HollyFrontier Navajo Refining LLC / Artesia Refinery / Renewable Diesel Unit /  
Verification of Non-Hazardous Injection Fluids from RDU Process – Pilot  
Sampling Plan

Dear Mr. Goetze:

Per our December 8, 2021 conference call, enclosed herein is the requested “Verification of Non-hazardous Injection Fluids from RDU Process - Pilot Sampling Plan” (presented as Appendix A). This Pilot Sampling Plan (“PSP”) is intended to characterize the HollyFrontier Navajo Refining LLC (“Navajo”) effluent discharge from the on-site wastewater treatment plant (“WWTP”) and the blowdown from certain cooling towers at Navajo’s Artesia Refinery once operations from the new Renewable Diesel Unit (“RDU”) have commenced. The WWTP effluent is currently discharged to both the City of Artesia POTW as well as four underground injection control (“UIC”) wells regulated collectively under the December 2017 Class I Non-Hazardous Waste Injection Well Discharge Permit UICI-8 as follows:

- Well WDW-1
  - API #30-015-27592 under Permit UICI-8-1 (Facility ID = fCJC2117350329)
- Well WDW-2
  - API #30-015-20894 under Permit UICI-8-2 (Facility ID = fCJC2117351808)
- Well WDW-3
  - API #30-015-26575 under Permit UICI-8-3 (Facility ID = fCJC2117354810)
- Well WDW-4
  - API #30-015-44677 under Permit UICI-8-4 (Facility ID = fCJC2117357871)

The New Mexico Oil Conservation Division, Engineering Bureau (“OCD”) has requested the PSP and subsequent sampling program to confirm that RDU operations will not result in the WWTP effluent to the UIC wells becoming characteristically hazardous under RCRA. The results of the sampling will be compared to the characteristic levels contained in 40 Code of Federal Regulations (CFR) Section 261.21 through 261.24 for ignitability, corrosivity, reactivity, and toxicity. Specific parameters of concern given in the PSP are those listed in Section 2.A of the December 2017 UICI-8 Discharge Permit; these parameters are currently monitored (and will continue to be once the RDU is in operation) on a quarterly basis. To determine if the new RDU operations have any

HollyFrontier Navajo Refining LLC  
hollyfrontier.com

additional potential effect on the quality (concentration) of the discharge to the UIC wells, the results from the PSP program will also be compared to historical monitoring data (pre-RDU).

Appendix B is the November 6, 2021 letter from Navajo to OCD. As explained in this letter, and pending confirmation by the PSP program:

- Current Refinery WWTP capacity will be sufficient to treat the additional RDU wastewater stream, and any corresponding increase in constituent concentrations will be reduced via treatment such that Navajo will be able to maintain compliance with current limitations set forth in Discharge Permit UICI-8.
- The RDU wastewater stream will not change the current flow and concentration characteristics of the Refinery WWTP discharge to the UIC well network; therefore, the RDU project will not affect the current terms of the UICI-8 Discharge Permit. In other words, effluent discharge quantity (flow), quality (concentrations), and injection pressure will meet current permitted limits/levels.

Navajo has reviewed all provisions of the December 2017 Class I Non-Hazardous Waste Injection Well Discharge Permit UICI-8 and cannot identify any amendments/changes that need to be made to accommodate the RDU discharge. The addition of RDU activities will not alter the operation, maintenance, or monitoring of the four underground injection wells. Specifically, under Section 1.G (Modification and Termination), and subject to confirmation by the PSP program, Navajo believes that permit modification for the existing UICI Discharge Permit should not be necessary. Based on results from the PSP program, OCD and Navajo can together make a determination as to whether further sampling may be warranted and/or if any other changes/revisions to the current Discharge Permit UICI-8 are necessary during permit renewal in 2022.

If you have any questions, please contact me by e-mail at [kawika.tupou@hollyfrontier.com](mailto:kawika.tupou@hollyfrontier.com) or by phone at 575-748-3311.

Sincerely,

Kawika Tupou  
Environmental Manager

Mike Holder, HollyFrontier Corporation

APPENDIX A - HollyFrontier Navajo Refining LLC		
Section:		Page: 1 of 3
Title: Verification of Non-hazardous Injection Fluids from RDU Process- Pilot Sampling Plan		
Status: Active	Revision Number: 0	Revision Date: 28 Jan 2022

### **Purpose**

This Pilot Sampling Plan ("PSP") is intended to characterize the HollyFrontier Navajo Refining LLC ("Navajo") effluent discharge from the on-site wastewater treatment plant ("WWTP") at Navajo's Artesia Refinery once operations from the new Renewable Diesel Unit ("RDU") have commenced. The WWTP effluent is currently discharged to both the City of Artesia POTW as well as four underground injection control ("UIC") wells regulated collectively under Class I Non-Hazardous Waste Injection Well Discharge Permit UICI-8 as follows:

1. Well WDW-1 (API #30-015-27592) under Permit UICI-8-1
2. Well WDW-2 (API #30-015-20894) under Permit UICI-8-2
3. Well WDW-3 (API #30-015-26575) under Permit UICI-8-3
4. Well WDW-4 (API #30-015-44677) under Permit UICI-8-4

In addition to the WWTP effluent, this PSP also covers sampling of the cooling tower blowdown ("CTB") from units Y-1, Y-2, Y-11, and Y-12 (which currently exist for refinery operations) as well as Y-26 (new cooling tower for RDU operations). The CTB sampling is included due to the potential discharge of these sources to the UIC wells as shown in Attachment 1. During normal conditions, all CTB discharges directly to the City POTW; however, CTB can be rerouted to the Refinery's onsite WWTP during emergency conditions for ultimate discharge to the City POTW and/or to the Refinery's UIC well network.

### **Sample Location**

Under Discharge Permit UICI-8, Section 2.A, Navajo collects quarterly samples of injected waste fluids (i.e., WWTP effluent) at the injection well pumps. This routine quarterly sampling is performed by AquaMicrobics according to the Procedure document provided in Attachment 2, which includes a map of the sampling location. This same sampling location will be utilized for the PSP to allow comparison of the historical quarterly data with data representative of RDU operations. The injection well pumps sampling site is representative of the WWTP effluent and is shown schematically on Attachment 1.

The PSP sample location for the CTB will be the current sample location for the combined CTB (from Y-1, Y-2, Y-11, and Y-12) and WWTP effluent that discharges to the POTW (schematically shown on Attachment 1. However, prior to the PSP sampling events, all WWTP effluent will be physically blocked (i.e., using the control valve as well as a manual block valve) and diverted to the injection wells so that the resulting discharge to the POTW only consists of CTB and can be sampled without the contribution of the WWTP effluent. A separate sampling point for just CTB does not currently exist; hence the procedure above. The CTB sampling Procedure document is provided in Attachment 3.

Title: Verification of Non-hazardous Injection Fluids from RDU Process- Pilot Sampling Plan		
Status: Active	Revision Number: 0	Revision Date: 28 Jan 2022

### **Sample Type and Parameters**

In accordance with Attachments 2 and 3, all samples (WWTP effluent and CTB) will be collected as grab samples representative of normal discharge flow conditions. The list of parameters for both the WWTP effluent and the CTB discharge will be identical to those required under Discharge Permit UICI-8, Section 2.A (quarterly monitoring); a summary of these parameters along with corresponding analytical methods and laboratory reporting levels (RLs) is given in Attachment 4. These parameters and methods have been identified in conjunction with regulatory authorities as the most appropriate for the UIC well program at Navajo over the life of the program and serve to characterize the Refinery effluent. Hall Environmental Laboratory (NELAP Certified) will perform all analyses under the chain-of-custody shown in Attachment 2, along with Level I standard QA/QC procedures.

### **Sample Frequency and Duration**

Once the RDU is online and corresponding operations are normal and representative, samples for the WWTP effluent and CTB will each be collected once per week for a month; for a total of four sampling events. Individual sample events may be collected during different days of the week and scheduling will be subject to facility operations and any weather conditions that might effect sample personnel safety. If sample events are delayed, the program will extend past one month until four events occur.

### **Data Compilation and Comparison**

Analytical results from the four sampling events will be compiled into Excel spreadsheets to allow statistical processing (i.e., averages, maximums, variability, etc.). Results will be reported along with the corresponding laboratory reporting levels.

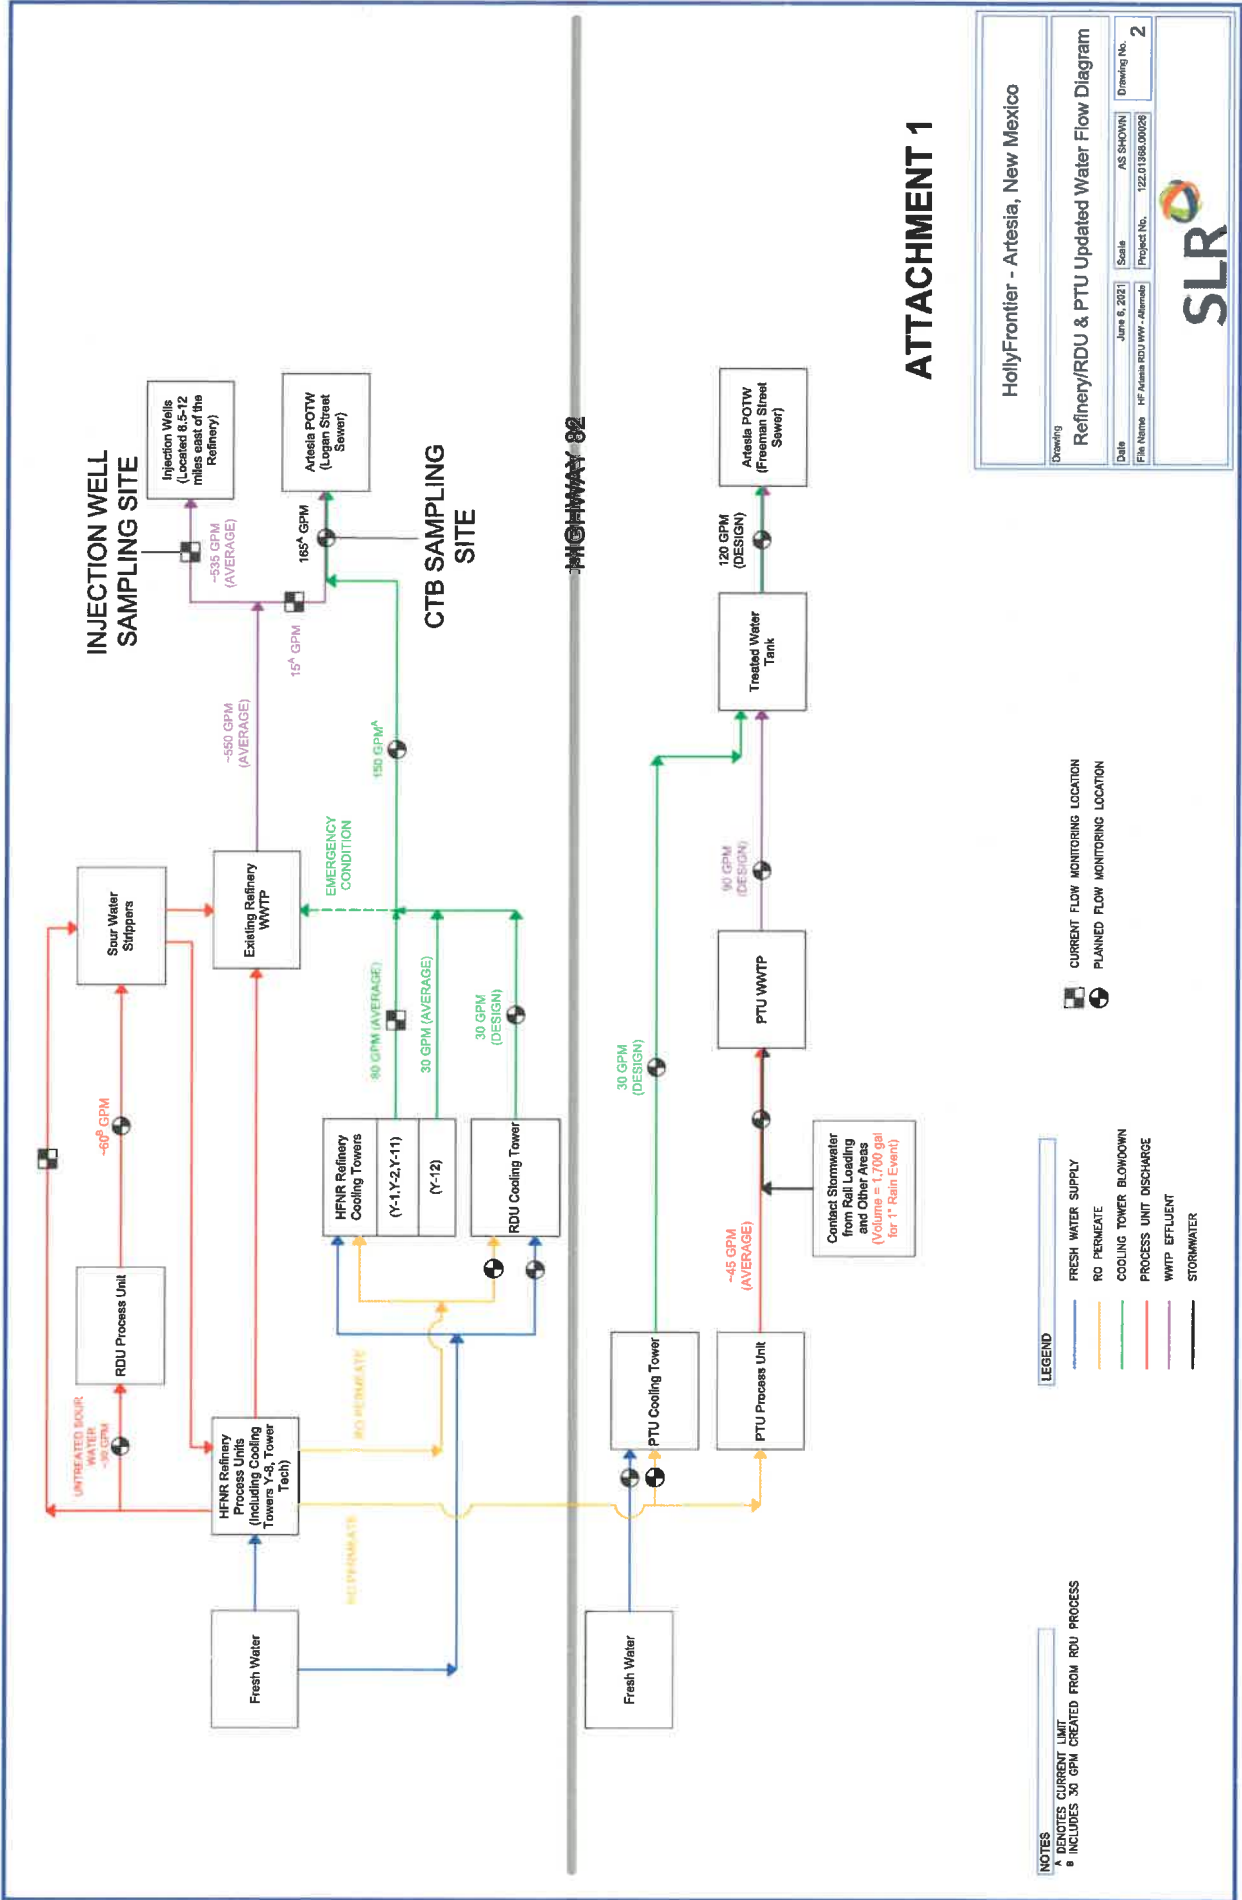

The primary purpose of this sampling program is to confirm that RDU operations will not result in the WWTP effluent to the UIC wells becoming characteristically hazardous under RCRA. The results of the sampling will be compared to the characteristic levels contained in 40 Code of Federal Regulations (CFR) Section 261.21-261.24 for ignitability, corrosivity, reactivity, and toxicity. To determine if the new RDU operations have any additional potential effect on the quality (concentration) of the discharge to the UIC wells, the results from the four sampling events (post-RDU) will also be compared to historical quarterly monitoring data (pre-RDU) as well as three CTB samples collected once per week prior to RDU start-up (i.e., without Y-26). Differences in average and maximum concentrations will be noted. Comparisons will be made for both the WWTP effluent and the CTB.

### **PSP Reporting**

A summary report of the results of the PSP program will be submitted to the Oil Conservation

APPENDIX A - HollyFrontier Navajo Refining LLC		
Section:		Page: 3 of 3
Title: Verification of Non-hazardous Injection Fluids from RDU Process- Pilot Sampling Plan		
Status: Active	Revision Number: 0	Revision Date: 28 Jan 2022

Division (OCD) within four weeks of receipt of the lab report for the final (fourth) sampling event. Based on this report, it is anticipated that OCD and Navajo will together make a determination as to whether further sampling may be warranted and/or if any other changes/revisions to the current Discharge Permit UICI-8 are necessary during permit renewal in 2022. If during the PSP program no impacts from RDU operations are observed on the discharge to the UIC wells , quarterly monitoring will resume in accordance with the current UICI-8 Discharge Permit.

**ATTACHMENT 2 - Quarterly WDW 1, 2, 3, & 4 Injection Well Sample Collection Procedure**

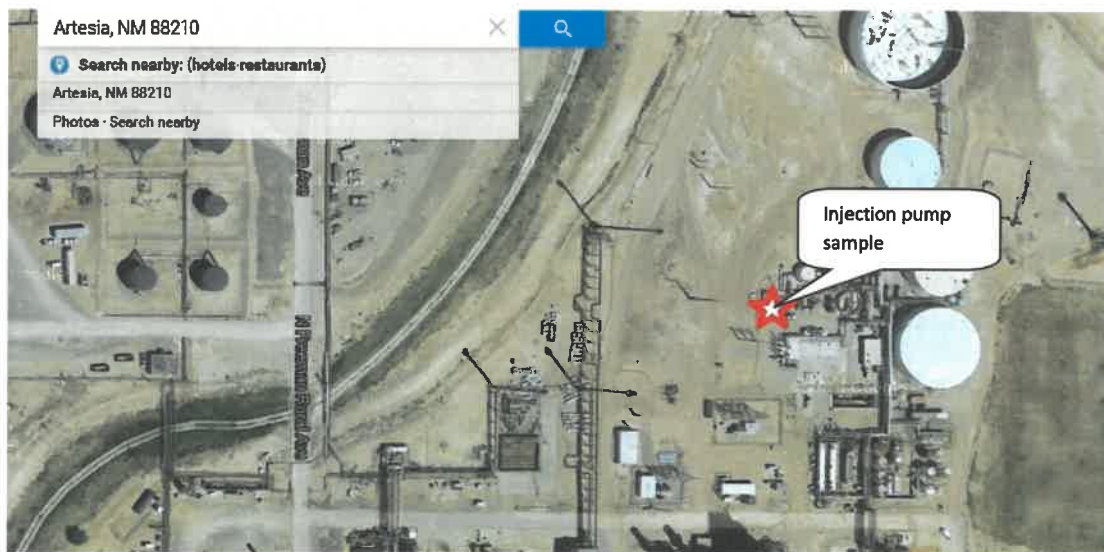

# Quarterly WDW 1, 2, 3, & 4 Injection Well

## Materials

- Pre-packaged ice chest that contains all sample bottles
- Quarterly WDW 1, 2, 3, & 4 Injection Well chain of custody
- Detailed Attachment of WDW 1, 2, 3, & 4 Injection Well
- Job Safety Analysis
- Portable pH meter
- Portable thermometer
- Clock
- Latex gloves
- Safety glasses
- Ice
- Ziploc bags
- Black tape
- Clear tape
- Keynote slip
- Sharpie or Good Quality Pen

## Procedures

- Acquire the pre-prepared WDW 1, 2, 3, & 4 ice chest from the environmental storage unit (the white shed between Carbon filters and Pipeline sample point)
- Confirm all bottles are labeled (you will need to add the time, date, and person who collected sample)
- Go to injection well pumps (red star on map below)
- 

- Take note of the time you begin sampling
- Using the portable pH probe obtain the pH of the water and write it down (make sure pH probe is calibrated)

1 | WDW 1, 2, 3, & 4 Injection Well

**ATTACHMENT 2 - Quarterly WDW 1, 2, 3, & 4 Injection Well Sample Collection Procedure**

- Using a portable thermometer obtain the temperature of the water sample and write it down
  - Fill all the empty containers with water from the sample point.
  - One sample is labeled to be filtered (use the filter provided in the ice chest)
  - Take note of the time you cease sampling
  - Wrap black tape tightly around the lids of the bottles taking care that all the lid is covered so that none of the sample can leak
  - Place the sample bottles in Ziploc bags (you will need multiple bags in order to hold all sample bottles)
  - Fill out the chains of custody [only fill out the yellow boxed portions] (make sure the time on the sheet is the same time listed on the bottles see purple star)
- Example:

If necessary, samples submitted to Hall Environmental may be subcontracted to other accredited laboratories. This serves as notice of this possibility. Any sub-contracted data will be clearly noted on the analytical report.

- Place chain of custody in a Ziploc bag and place inside ice chest
- Confirm all bottles are sealed in Ziploc bags
- Collect ice in ice chest making sure to cover all sides of sample
- Tape the outside of the ice chest with the clear tape
- When courier arrives, go to main gate and relinquish the samples

**If you need to ship the samples**

- Take ice chest and extra Ziploc bags to Navajo lab
- Before entering Navajo Labs put on clear safety glasses

2 | WDW 1, 2, 3, &amp; 4 Injection Well

**ATTACHMENT 2 - Quarterly WDW 1, 2, 3, & 4 Injection Well Sample Collection Procedure**

- Place ice inside of a Ziploc bag and seal completely so no water leaks
- Do this with multiple Ziploc bags until the entire sample is covered in ice
- Take ice chest to the welcome desk which is located in Navajo Main office
- Weigh ice chest on the scale provided to the right of computer
- Fill out a shipping label using the computer; type in the shipping location, the weight, of your package, mark that it is your shipping material, charge to sender, and charge environmental department (if you have any questions ask the person working at the front desk)
- At 3:00 pm go to Navajo lab and replace the ice that is in the Ziploc bags (making sure that nothing leaks)
- Add the shipping label to the outside of ice chest
- Hold on to copy of tracking number
- Make sure to completely seal the ice chest by wrapping all corners with clear tape
- Place the sealed ice chest in the FedEx shed located at the warehouse by 3:30 p.m.

**Chain of Custody Sample Information**

Please be sure to include accurate **Field Temperature** and **pH** of any sample collected. Upon being collected, samples are to be immediately taken to the AquaMicrobics lab so that a pH test can be performed. It is also acceptable to use the Temperature reading from the pH probe for the field temperature reading of the sample.

**ATTACHMENT 3 – Cooling Tower Blowdown (CTB) Sample Collection Procedure****Purpose**

This procedure is for sampling events for wastewater discharged from the Artesia facility to the City of Artesia POTW, which includes discharges from the onsite wastewater treatment plant (WWTP) and cooling tower blowdown (CTB) streams from Y-1, Y-2, Y-11, Y-12, and Y-26 (post-RDU).

**Scope and Application**

This guideline applies to all HollyFrontier Navajo Refining LLC (Navajo or HFNR) employees, contractors and visitors.

The sampling is located at the sample station near the Artesia WWTP Effluent Outfall to the POTW, downstream of the confluence of the cooling tower blowdown (CTB from Y-1, Y-2, Y-11, Y-12, and Y-26) and Walnut Shell Filter (WWTP) effluent (see map below). For CTB sampling, the WWTP effluent will be blocked (i.e., diverted) to the injection wells so that the resulting discharge to the POTW only consists of CTB.

---

**Reference Document**

This procedure has been prepared in accordance with the US EPA guidance document on wastewater sampling: [https://www.epa.gov/sites/production/files/2017-07/documents/wastewater\\_sampling306\\_af.r4.pdf](https://www.epa.gov/sites/production/files/2017-07/documents/wastewater_sampling306_af.r4.pdf)

**ATTACHMENT 3 – Cooling Tower Blowdown (CTB) Sample Collection Procedure****Needed Materials**

- Job Safety Analysis
- Appropriate Personal Protective Equipment (PPE) as dictated by HFNR requirements. These include, but are not limited to: FRC clothing, safety glasses, hardhat, steel-toe boots, nitrile gloves, and hearing protection;
- Sample Chain of Custody (COC) form (provided by contract laboratory – see Attachment 2);
- Labeled Sample Bottles: Date, time, sample location, preservation method, and analyses (provided by contract laboratory);
- Five-gallon bucket;
- Glass beaker for sample pouring (if needed) and pH measurement;
- Calibrated pH probe / meter (refer to pH Meter Calibration SOP);
- Ice chest filled with ice;
- Appropriate material to wipe sample bottles clean; and
- Electrical tape.

**Please Note-** All safety and PPE precautions should be taken in accordance with Navajo SDS and safety procedures applicable for the material being sampled. Navajo personnel will comply with all safety, handling and disposal information and precautions set forth in those documents.

**Special Sampling Considerations**

- A clean pair of new, non-powdered disposable nitrile gloves will be worn each time a location is sampled, and the gloves should be donned immediately prior to sampling;
- Wastewater samples will typically be collected either by directly filling the sample container or by using an interim container that fills the sample container;
- During sample collection, if transferring the sample from a collection device or container, make sure the device or interim container does not come in contact with the sample containers;
- Place the samples into the appropriate, labeled containers as provided by the contract laboratory;
- All samples requiring preservation must be preserved as soon as practically possible, ideally immediately at the time of sample collection. Note: The contract laboratory will add the appropriate preservatives to the corresponding sample bottles; and
- Do not overfill sample bottles containing preservative to prevent any loss.

**Manual Sampling**

Manual sampling is normally used for collecting grab samples and/or for immediate in-situ field analyses. The best method to manually collect a sample is to use the actual sample container which will be used to transport the sample to the laboratory. This eliminates the possibility of contaminating the sample with intermediate collection containers.

If the wastewater stream cannot be physically reached by the sampling personnel or it is not safe to reach for the sample, an intermediate collection container may be used, from which the sample can be redistributed to other containers.

**ATTACHMENT 3 – Cooling Tower Blowdown (CTB) Sample Collection Procedure**

For locations where samples can be collected from a sample port, valve, or spigot, place a five-gallon bucket under the sample location and allow the sample to run for at least one minute before collection to clear the lines.

**Quality Control and Documentation**

Equipment blanks should be collected if equipment is field cleaned and re-used on-site or if necessary, to document that low-level contaminants were not introduced by the sampling equipment.

Chain of Custody forms must stay with the samples at all times and must be filled out each time sample control is transferred to another individual or entity.

**Sample Bottles and Collection**

Trace metals and organics detection limits are typically in the parts per billion (ppb or µg/L), so extreme care must be exercised to ensure sample integrity. When possible, the sample should be collected directly into the appropriate sample container. If the material to be sampled cannot be physically reached, an intermediate collection device may be used.

The sample container to be analyzed may contain a preservative. Care should be taken not to flush any preservative out of the container during fill.

**Sampling Procedure**

1. Don PPE.
2. Inspect all sample bottles to ensure that they are clean and in good condition.
3. Verify all sample bottles are labeled with the appropriate preservative. Labels shall include:
  - a. Sample location;
  - b. Date;
  - c. Time;
  - d. Sampler's initials;
  - e. Requested analyses; and
  - f. Preservative type.
4. Proceed to the sample station near the Artesia WWTP Effluent Outfall to the POTW. This location is downstream of the confluence of the cooling tower blowdown (CTB) and WWTP Effluent (see map above).
5. Collect samples:
  - a. Don new, clean gloves;
  - b. Place a five-gallon bucket under the sample point to collect the flush water and any spillage;
  - c. Open the sample tap and allow the sample to run for at least one minute to flush the lines;
  - d. **NEVER** leave an open sample point unattended for any reason;

**ATTACHMENT 3 – Cooling Tower Blowdown (CTB) Sample Collection Procedure**

- e. Place each bottle under the open, running sample port. A clean, glass beaker may be used as an interim container for ease of pouring, if needed. Fill each bottle to near the top, ensuring not to overfill to retain all the sample preservative (if present);
  - f. Close the sample tap;
  - g. Tape down all sample bottle lids with electrical tape;
  - h. Place sample bottles in cooler filled with ice;
  - i. Fill glass beaker with sample for pH and temperature measurement;
  - j. Using a calibrated pH meter and probe, measure the pH and temperature of the wastewater sample and record results on the Chain of Custody form;
  - k. Fully complete the sample Chain of Custody, ensuring the COC contains:
    - i. Date;
    - ii. Time;
    - iii. Sampler's name, initials, and signature;
    - iv. Line item for each sample bottle; and
    - v. Requested analyses;
  - l. Place completed COC into plastic bag and place on top of sample inside the cooler;
  - m. Close and secure cooler lid; and
  - n. Relinquish sample to contract laboratory courier.
6. If any quantity of material has spilled onto the ground, it must be cleaned up immediately as per HFNR's spill response procedures.
  7. Dispose of any material from the five-gallon bucket and excess sample in the glass beaker used in temperature and pH measurement by emptying into an approved drain. This is either the sewer box near the Talon tanks or the laboratory sink.
  8. Decontaminate and triple rinse all interim sample containers and PPE used, except for nitrile gloves, which should be disposed of in an appropriate trash receptacle.
  9. **If any conditions arise which would alter or prevent sampling as described in this document or if there are any questions or concerns regarding the sampling of a particular source or location, contact the HFNR Supervisor immediately for further guidance prior to performing sampling.**

**END OF PROCEDURE**

Albuquerque, New Mexico 87113

RE: HollyFrontier Navajo Refining LLC / Artesia Refinery / Renewable Diesel & Pretreatment Unit Projects /Response to OCD Request for Proposal on Potential Amendment of Discharge Permits for Four Class I Non-Hazardous Waste Injection Wells

Dear Mr. Goetze:

In response to Ms. Leigh Barr's September 24, 2021 letter regarding the Oil Conservation Division's ("OCD") jurisdictional authority pertaining to the Renewable Diesel Unit ("RDU") and Pretreatment Unit ("PTU") projects at the HollyFrontier Navajo Refining LLC ("Navajo") facility, Navajo acknowledges OCD's conclusion that the RDU and PTU fall under OCD's jurisdiction. As requested in the last paragraph of the September 24, 2021 OCD transmittal, this letter serves as a formal response to OCD's request for proposal regarding the potential amendment of Navajo's current Class I Non-Hazardous Waste Injection Well Discharge Permits UICI-8-1, UICI-8-2, UICI-8-3, and UICI-8-4. Navajo intends to discharge treated RDU wastewater to the four underground injection control ("UIC") wells (WDW-1, WDW-2, WDW-3, and WDW-4) currently regulated by these permits following treatment at Navajo's on-site wastewater treatment plant ("WWTP") in the same manner as effluent already discharged from the refinery (*i.e.*, treated effluent from the WWTP can go to any or all wells depending on refinery/RDU needs). There will be no discharge of treated PTU wastewater to any of these wells as all PTU effluent will be discharged to the City of Artesia's Publicly Owned Treatment Works (POTW) via a new discharge permit with the City.

**Background**

As presented in detail in the June 11, 2021 Navajo letter to OCD, in addition to current petroleum refining operations, the HollyFrontier organization is in the process of constructing and will operate a 9,000 barrel per day ("bpd") Renewable Diesel Unit, *i.e.*, a renewable diesel production facility, and a 13,000 bpd Pretreatment Unit to treat certain feedstocks for the RDU. Drawing 2, Water Flow Diagram, is reproduced from this letter herein to show wastewater

streams currently anticipated to be generated in connection with operations of the RDU and PTU.

- RDU process wastewater will be routed for treatment through the Refinery WWTP and will be discharged consistent with the current discharge configuration at the Refinery, including to the City of Artesia's POTW and to the Refinery's four permitted UIC wells. Since current Refinery WWTP capacity will be sufficient to treat the additional RDU wastewater stream (i.e., approximately 30 gpm discharged to the City POTW), any corresponding increase in constituent concentrations will be reduced via treatment such that Navajo will be able to maintain compliance with current federal, state and local concentration effluent limitations as well as current limitations set forth in Discharge Permits UICI-8-1, UICI-8-2, UICI-8-3, and UICI-8-4.
- A new Cooling Tower ("CT") will be installed to provide cooling for the RDU. RDU CT blowdown (approximately 30 gpm) will normally be routed to combine with the Refinery CT blowdown stream that is directly discharged to the POTW (and not the UIC wells). As shown on Drawing 2, in the event of an emergency condition, the RDU CT blowdown can be rerouted to the Refinery's onsite WWTP, for ultimate discharge to the City POTW and/or to the Refinery's UIC well network (consistent with current discharge permit levels).
- All process wastewater from the PTU (approximately 90 gpm) will be collected and routed to a new PTU wastewater treatment plant (the "PTU WWTP") for treatment prior to discharge to the City POTW via a newly permitted outfall. There is no planned discharge of PTU WWTP wastewater to the Refinery WWTP, and, therefore, no planned discharge to the UIC well network.
- A new CT will be installed to provide cooling for the PTU and the PTU WWTP. There is no planned discharge of PTU CT blowdown (approximately 30 gpm) to the UIC well network.
- PTU and rail loading/unloading areas have been designed to minimize stormwater exposure; however, a small volume of contact stormwater from these areas is expected. This contact stormwater will be collected and routed to the PTU WWTP for treatment and subsequent discharge to the POTW sewer and will not be discharged to the UIC well network.

#### **UICI Regulation and Permitting**

The RDU wastewater stream will constitute a small component of the combined RDU/Refinery process wastewater stream prior to treatment and discharge to the UIC well network. Due to the small RDU wastewater contribution and preliminary estimates of the RDU wastewater stream quality (i.e., prior to treatment), it is anticipated that the current Refinery WWTP capacity will be sufficient to treat the additional RDU wastewater stream. Therefore, Navajo is expected to

maintain compliance with current limitations and requirements set forth in Discharge Permits UICI-8-1, UICI-8-2, UICI-8-3, and UICI-8-4.

For the PTU wastewater stream, including the PTU CT blowdown, there will be no anticipated discharge of PTU wastewaters to the UIC well network, and as a result, there will be no effect from the PTU on Discharge Permits UICI-8-1, UICI-8-2, UICI-8-3, and UICI-8-4.

Given that the RDU wastewater stream will not change the current flow and concentration characteristics of the Refinery WWTP discharge to the UIC well network (as well as the fact of no wastewater contribution from the PTU discharge to the UIC well network), the RDU/PTU projects will not affect the current terms of the four UICI Discharge Permits. In other words, effluent discharge quantity (flow), quality (concentrations), or injection pressure are not expected to increase from current permitted limits/levels. These discharge characteristics, currently reported by Navajo on a quarterly basis, will remain the same once the RDU/PTU is online; summaries for wells WDW-1, WDW-2, WDW-3, and WDW-4 from January 1, 2021 to September 30, 2021 are given in Tables 1 and 2 as a reference.

Navajo has reviewed all provisions of the four December 2017 Class I Non-Hazardous Waste Injection Well Discharge Permits and cannot identify any amendments/changes that need to be made to accommodate the RDU/PTU discharge. The addition of RDU/PTU activities will not alter the operation, maintenance, or monitoring of the four underground injection wells. Therefore, Navajo believes that permit modifications for the existing UICI Discharge Permits are not necessary at this time. As a result, and subject to OCD concurrence, Navajo proposes that the current UICI Discharge Permits be maintained in their entirety until their December 2022 expiration, given that the RDU/PTU projects come online prior to this date.

Please let us know if you would like to discuss the above response and/or would like additional information. We look forward to your feedback and thank you in advance for your consideration.

Sincerely,

Kawika Tupou  
Environmental Manager

RE: HollyFrontier Navajo Refining LLC / Artesia Refinery / Renewable Diesel Unit /  
Verification of Non-Hazardous Injection Fluids from RDU Process – Pilot  
Sampling Plan

Dear Mr. Goetze:

Per our December 8, 2021 conference call, enclosed herein is the requested “Verification of Non-hazardous Injection Fluids from RDU Process - Pilot Sampling Plan” (presented as Appendix A). This Pilot Sampling Plan (“PSP”) is intended to characterize the HollyFrontier Navajo Refining LLC (“Navajo”) effluent discharge from the on-site wastewater treatment plant (“WWTP”) and the blowdown from certain cooling towers at Navajo’s Artesia Refinery once operations from the new Renewable Diesel Unit (“RDU”) have commenced. The WWTP effluent is currently discharged to both the City of Artesia POTW as well as four underground injection control (“UIC”) wells regulated collectively under the December 2017 Class I Non-Hazardous Waste Injection Well Discharge Permit UICI-8 as follows:

- Well WDW-1
  - API #30-015-27592 under Permit UICI-8-1 (Facility ID = fCJC2117350329)
- Well WDW-2
  - API #30-015-20894 under Permit UICI-8-2 (Facility ID = fCJC2117351808)
- Well WDW-3
  - API #30-015-26575 under Permit UICI-8-3 (Facility ID = fCJC2117354810)
- Well WDW-4
  - API #30-015-44677 under Permit UICI-8-4 (Facility ID = fCJC2117357871)

The New Mexico Oil Conservation Division, Engineering Bureau (“OCD”) has requested the PSP and subsequent sampling program to confirm that RDU operations will not result in the WWTP effluent to the UIC wells becoming characteristically hazardous under RCRA. The results of the sampling will be compared to the characteristic levels contained in 40 Code of Federal Regulations (CFR) Section 261.21 through 261.24 for ignitability, corrosivity, reactivity, and toxicity. Specific parameters of concern given in the PSP are those listed in Section 2.A of the December 2017 UICI-8 Discharge Permit; these parameters are currently monitored (and will continue to be once the RDU is in operation) on a quarterly basis. To determine if the new RDU operations have any

additional potential effect on the quality (concentration) of the discharge to the UIC wells, the results from the PSP program will also be compared to historical monitoring data (pre-RDU).

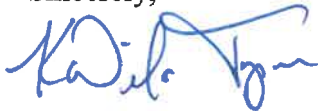

Appendix B is the November 6, 2021 letter from Navajo to OCD. As explained in this letter, and pending confirmation by the PSP program:

- Current Refinery WWTP capacity will be sufficient to treat the additional RDU wastewater stream, and any corresponding increase in constituent concentrations will be reduced via treatment such that Navajo will be able to maintain compliance with current limitations set forth in Discharge Permit UICI-8.
- The RDU wastewater stream will not change the current flow and concentration characteristics of the Refinery WWTP discharge to the UIC well network; therefore, the RDU project will not affect the current terms of the UICI-8 Discharge Permit. In other words, effluent discharge quantity (flow), quality (concentrations), and injection pressure will meet current permitted limits/levels.

Navajo has reviewed all provisions of the December 2017 Class I Non-Hazardous Waste Injection Well Discharge Permit UICI-8 and cannot identify any amendments/changes that need to be made to accommodate the RDU discharge. The addition of RDU activities will not alter the operation, maintenance, or monitoring of the four underground injection wells. Specifically, under Section 1.G (Modification and Termination), and subject to confirmation by the PSP program, Navajo believes that permit modification for the existing UICI Discharge Permit should not be necessary. Based on results from the PSP program, OCD and Navajo can together make a determination as to whether further sampling may be warranted and/or if any other changes/revisions to the current Discharge Permit UICI-8 are necessary during permit renewal in 2022.

If you have any questions, please contact me by e-mail at [kawika.tupou@hollyfrontier.com](mailto:kawika.tupou@hollyfrontier.com) or by phone at 575-748-3311.

Sincerely,

Kawika Tupou  
Environmental Manager

APPENDIX A - HollyFrontier Navajo Refining LLC		
Section:		Page: 1 of 3
Title: Verification of Non-hazardous Injection Fluids from RDU Process- Pilot Sampling Plan		
Status: Active	Revision Number: 0	Revision Date: 28 Jan 2022

### **Purpose**

This Pilot Sampling Plan ("PSP") is intended to characterize the HollyFrontier Navajo Refining LLC ("Navajo") effluent discharge from the on-site wastewater treatment plant ("WWTP") at Navajo's Artesia Refinery once operations from the new Renewable Diesel Unit ("RDU") have commenced. The WWTP effluent is currently discharged to both the City of Artesia POTW as well as four underground injection control ("UIC") wells regulated collectively under Class I Non-Hazardous Waste Injection Well Discharge Permit UICI-8 as follows:

1. Well WDW-1 (API #30-015-27592) under Permit UICI-8-1
2. Well WDW-2 (API #30-015-20894) under Permit UICI-8-2
3. Well WDW-3 (API #30-015-26575) under Permit UICI-8-3
4. Well WDW-4 (API #30-015-44677) under Permit UICI-8-4

In addition to the WWTP effluent, this PSP also covers sampling of the cooling tower blowdown ("CTB") from units Y-1, Y-2, Y-11, and Y-12 (which currently exist for refinery operations) as well as Y-26 (new cooling tower for RDU operations). The CTB sampling is included due to the potential discharge of these sources to the UIC wells as shown in Attachment 1. During normal conditions, all CTB discharges directly to the City POTW; however, CTB can be rerouted to the Refinery's onsite WWTP during emergency conditions for ultimate discharge to the City POTW and/or to the Refinery's UIC well network.

### **Sample Location**

Under Discharge Permit UICI-8, Section 2.A, Navajo collects quarterly samples of injected waste fluids (i.e., WWTP effluent) at the injection well pumps. This routine quarterly sampling is performed by AquaMicrobics according to the Procedure document provided in Attachment 2, which includes a map of the sampling location. This same sampling location will be utilized for the PSP to allow comparison of the historical quarterly data with data representative of RDU operations. The injection well pumps sampling site is representative of the WWTP effluent and is shown schematically on Attachment 1.

The PSP sample location for the CTB will be the current sample location for the combined CTB (from Y-1, Y-2, Y-11, and Y-12) and WWTP effluent that discharges to the POTW (schematically shown on Attachment 1. However, prior to the PSP sampling events, all WWTP effluent will be physically blocked (i.e., using the control valve as well as a manual block valve) and diverted to the injection wells so that the resulting discharge to the POTW only consists of CTB and can be sampled without the contribution of the WWTP effluent. A separate sampling point for just CTB does not currently exist; hence the procedure above. The CTB sampling Procedure document is provided in Attachment 3.

APPENDIX A - HollyFrontier Navajo Refining LLC		
Section:		Page: 2 of 3
Title: Verification of Non-hazardous Injection Fluids from RDU Process-Pilot Sampling Plan		
Status: Active	Revision Number: 0	Revision Date: 28 Jan 2022

### **Sample Type and Parameters**

In accordance with Attachments 2 and 3, all samples (WWTP effluent and CTB) will be collected as grab samples representative of normal discharge flow conditions. The list of parameters for both the WWTP effluent and the CTB discharge will be identical to those required under Discharge Permit UICI-8, Section 2.A (quarterly monitoring); a summary of these parameters along with corresponding analytical methods and laboratory reporting levels (RLs) is given in Attachment 4. These parameters and methods have been identified in conjunction with regulatory authorities as the most appropriate for the UIC well program at Navajo over the life of the program and serve to characterize the Refinery effluent. Hall Environmental Laboratory (NELAP Certified) will perform all analyses under the chain-of-custody shown in Attachment 2, along with Level I standard QA/QC procedures.

### **Sample Frequency and Duration**

Once the RDU is online and corresponding operations are normal and representative, samples for the WWTP effluent and CTB will each be collected once per week for a month; for a total of four sampling events. Individual sample events may be collected during different days of the week and scheduling will be subject to facility operations and any weather conditions that might effect sample personnel safety. If sample events are delayed, the program will extend past one month until four events occur.

### **Data Compilation and Comparison**

Analytical results from the four sampling events will be compiled into Excel spreadsheets to allow statistical processing (i.e., averages, maximums, variability, etc.). Results will be reported along with the corresponding laboratory reporting levels.

The primary purpose of this sampling program is to confirm that RDU operations will not result in the WWTP effluent to the UIC wells becoming characteristically hazardous under RCRA. The results of the sampling will be compared to the characteristic levels contained in 40 Code of Federal Regulations (CFR) Section 261.21-261.24 for ignitability, corrosivity, reactivity, and toxicity. To determine if the new RDU operations have any additional potential effect on the quality (concentration) of the discharge to the UIC wells, the results from the four sampling events (post-RDU) will also be compared to historical quarterly monitoring data (pre-RDU) as well as three CTB samples collected once per week prior to RDU start-up (i.e., without Y-26). Differences in average and maximum concentrations will be noted. Comparisons will be made for both the WWTP effluent and the CTB.

### **PSP Reporting**

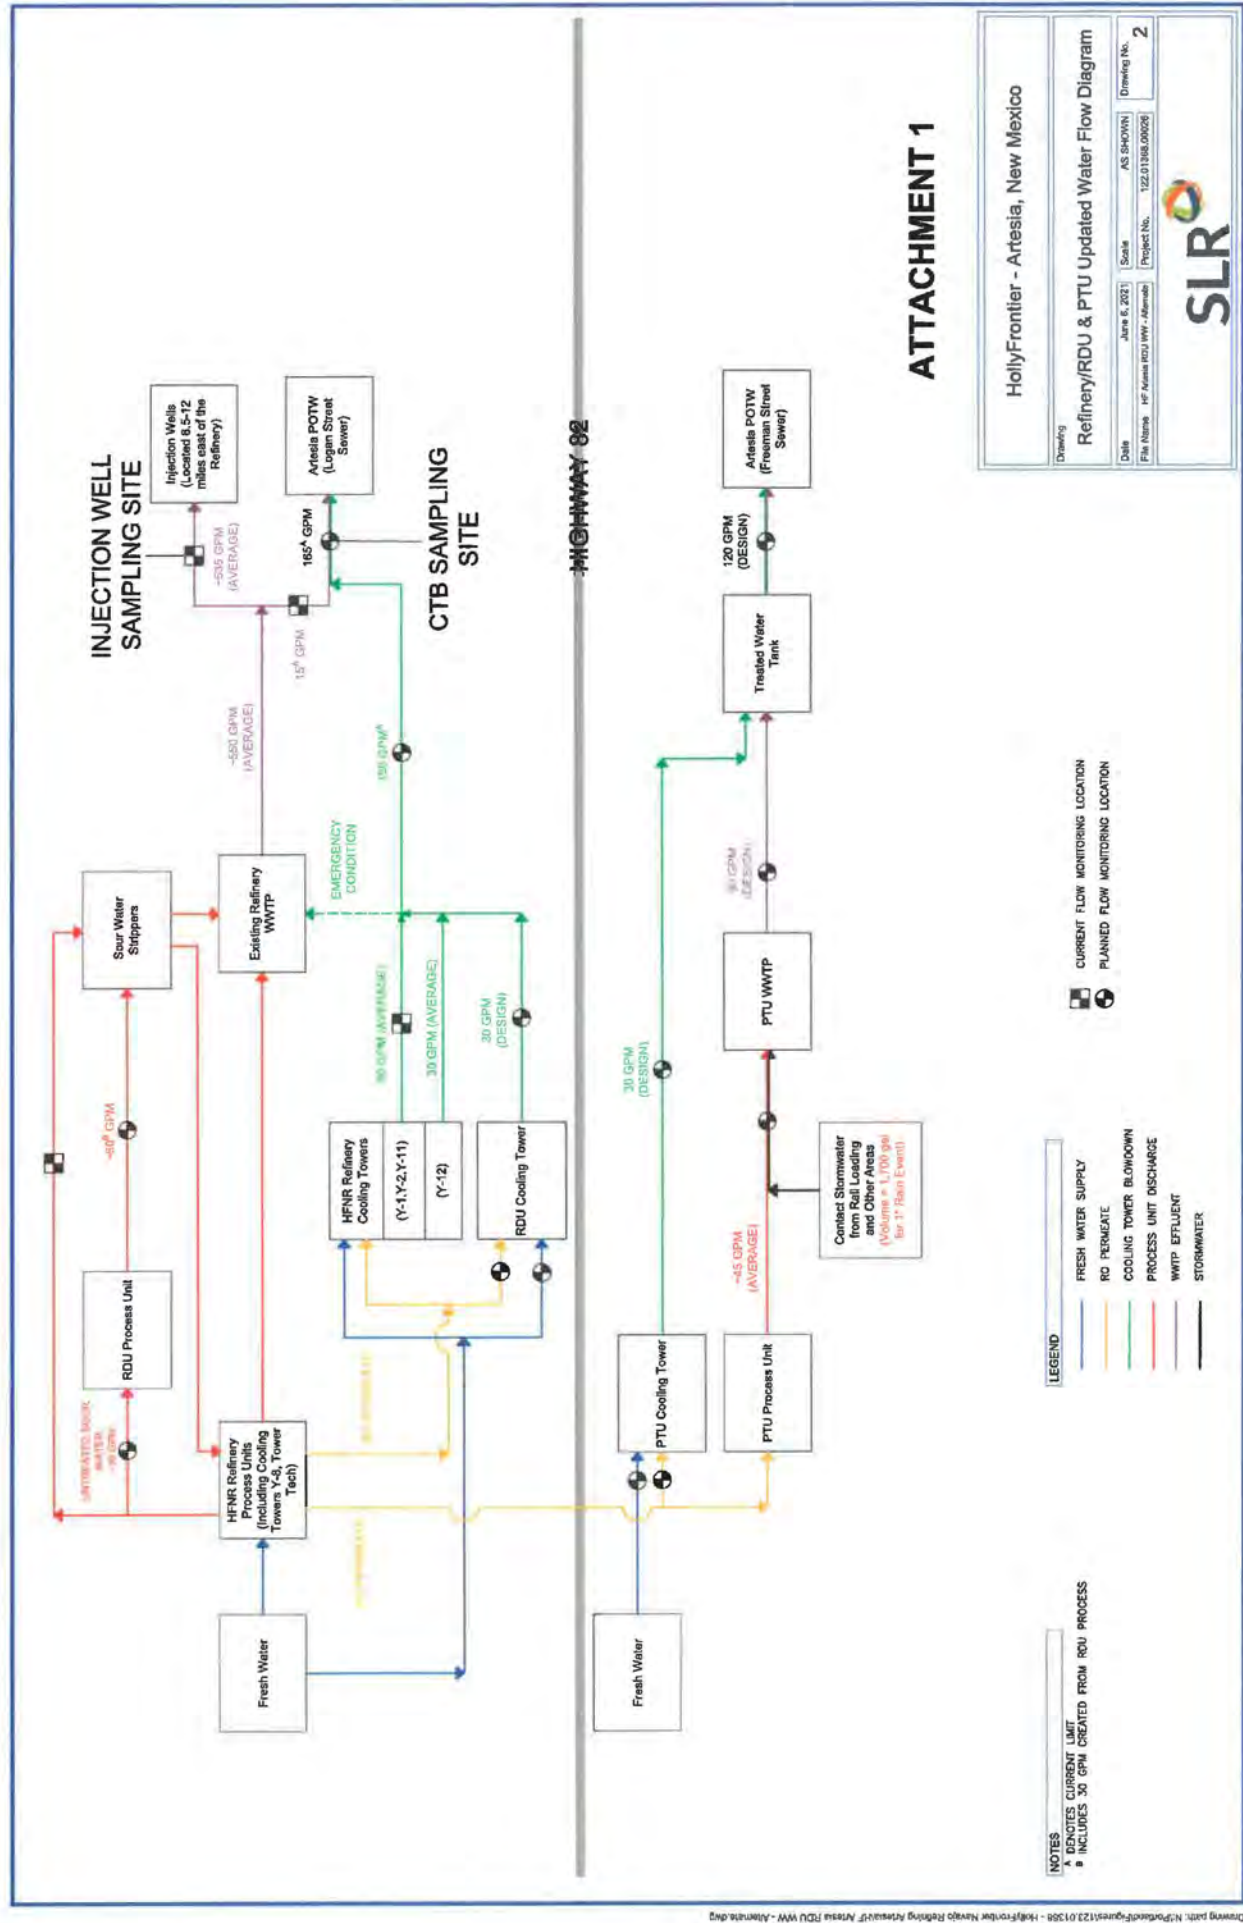

A summary report of the results of the PSP program will be submitted to the Oil Conservation

APPENDIX A - HollyFrontier Navajo Refining LLC		
Section:		Page: 3 of 3
Title: Verification of Non-hazardous Injection Fluids from RDU Process- Pilot Sampling Plan		
Status: Active	Revision Number: 0	Revision Date: 28 Jan 2022

Division (OCD) within four weeks of receipt of the lab report for the final (fourth) sampling event. Based on this report, it is anticipated that OCD and Navajo will together make a determination as to whether further sampling may be warranted and/or if any other changes/revisions to the current Discharge Permit UICI-8 are necessary during permit renewal in 2022. If during the PSP program no impacts from RDU operations are observed on the discharge to the UIC wells , quarterly monitoring will resume in accordance with the current UICI-8 Discharge Permit.

**ATTACHMENT 2 - Quarterly WDW 1, 2, 3, & 4 Injection Well Sample Collection Procedure**

# Quarterly WDW 1, 2, 3, & 4 Injection Well

## Materials

- Pre-packaged ice chest that contains all sample bottles
- Quarterly WDW 1, 2, 3, & 4 Injection Well chain of custody
- Detailed Attachment of WDW 1, 2, 3, & 4 Injection Well
- Job Safety Analysis
- Portable pH meter
- Portable thermometer
- Clock
- Latex gloves
- Safety glasses
- Ice
- Ziploc bags
- Black tape
- Clear tape
- Keynote slip
- Sharpie or Good Quality Pen

## Procedures

- Acquire the pre-prepared WDW 1, 2, 3, & 4 ice chest from the environmental storage unit (the white shed between Carbon filters and Pipeline sample point)
- Confirm all bottles are labeled (you will need to add the time, date, and person who collected sample)
- Go to injection well pumps (red star on map below)
- 

- Take note of the time you begin sampling
- Using the portable pH probe obtain the pH of the water and write it down (make sure pH probe is calibrated)

- Using a portable thermometer obtain the temperature of the water sample and write it down
- Fill all the empty containers with water from the sample point.
- One sample is labeled to be filtered (use the filter provided in the ice chest)
- Take note of the time you cease sampling
- Wrap black tape tightly around the lids of the bottles taking care that all the lid is covered so that none of the sample can leak
- Place the sample bottles in Ziploc bags (you will need multiple bags in order to hold all sample bottles)
- Fill out the chains of custody [only fill out the yellow boxed portions] (make sure the time on the sheet is the same time listed on the bottles see purple star)

Remarks: Report these results separately from all other Chain of Custody kits provided

If necessary, samples submitted to Hall Environmental must be accompanied by the attached documentation. This service is rendered at the discretion of Hall Environmental. Any information provided will be clearly noted on the analytical report.

- Place chain of custody in a Ziploc bag and place inside ice chest
- Confirm all bottles are sealed in Ziploc bags
- Collect ice in ice chest making sure to cover all sides of sample
- Tape the outside of the ice chest with the clear tape
- When currier arrives, go to main gate and relinquish the samples

- Take ice chest and extra Ziploc bags to Navajo lab
- Before entering Navajo Labs put on clear safety glasses

Released to Imaging: 2/28/2022 2:48:58 PM

**ATTACHMENT 2 - Quarterly WDW 1, 2, 3, & 4 Injection Well Sample Collection Procedure**

- Place ice inside of a Ziploc bag and seal completely so no water leaks
- Do this with multiple Ziploc bags until the entire sample is covered in ice
- Take ice chest to the welcome desk which is located in Navajo Main office
- Weigh ice chest on the scale provided to the right of computer
- Fill out a shipping label using the computer; type in the shipping location, the weight, of your package, mark that it is your shipping material, charge to sender, and charge environmental department (if you have any questions ask the person working at the front desk)
- At 3:00 pm go to Navajo lab and replace the ice that is in the Ziploc bags (making sure that nothing leaks)
- Add the shipping label to the outside of ice chest
- Hold on to copy of tracking number
- Make sure to completely seal the ice chest by wrapping all corners with clear tape
- Place the sealed ice chest in the FedEx shed located at the warehouse by 3:30 p.m.

**Chain of Custody Sample Information**

Please be sure to include accurate **Field Temperature** and **pH** of any sample collected. Upon being collected, samples are to be immediately taken to the AquaMicrobics lab so that a pH test can be performed. It is also acceptable to use the Temperature reading from the pH probe for the field temperature reading of the sample.

**ATTACHMENT 3 – Cooling Tower Blowdown (CTB) Sample Collection Procedure****Purpose**

This procedure is for sampling events for wastewater discharged from the Artesia facility to the City of Artesia POTW, which includes discharges from the onsite wastewater treatment plant (WWTP) and cooling tower blowdown (CTB) streams from Y-1, Y-2, Y-11, Y-12, and Y-26 (post-RDU).

**Scope and Application**

This guideline applies to all HollyFrontier Navajo Refining LLC (Navajo or HFNR) employees, contractors and visitors.

The sampling is located at the sample station near the Artesia WWTP Effluent Outfall to the POTW, downstream of the confluence of the cooling tower blowdown (CTB from Y-1, Y-2, Y-11, Y-12, and Y-26) and Walnut Shell Filter (WWTP) effluent (see map below). For CTB sampling, the WWTP effluent will be blocked (i.e., diverted) to the injection wells so that the resulting discharge to the POTW only consists of CTB.

---

**Reference Document**

This procedure has been prepared in accordance with the US EPA guidance document on wastewater sampling: [https://www.epa.gov/sites/production/files/2017-07/documents/wastewater\\_sampling306\\_af.r4.pdf](https://www.epa.gov/sites/production/files/2017-07/documents/wastewater_sampling306_af.r4.pdf)

**ATTACHMENT 3 – Cooling Tower Blowdown (CTB) Sample Collection Procedure****Needed Materials**

- Job Safety Analysis
- Appropriate Personal Protective Equipment (PPE) as dictated by HFNR requirements. These include, but are not limited to: FRC clothing, safety glasses, hardhat, steel-toe boots, nitrile gloves, and hearing protection;
- Sample Chain of Custody (COC) form (provided by contract laboratory – see Attachment 2);
- Labeled Sample Bottles: Date, time, sample location, preservation method, and analyses (provided by contract laboratory);
- Five-gallon bucket;
- Glass beaker for sample pouring (if needed) and pH measurement;
- Calibrated pH probe / meter (refer to pH Meter Calibration SOP);
- Ice chest filled with ice;
- Appropriate material to wipe sample bottles clean; and
- Electrical tape.

**Please Note-** All safety and PPE precautions should be taken in accordance with Navajo SDS and safety procedures applicable for the material being sampled. Navajo personnel will comply with all safety, handling and disposal information and precautions set forth in those documents.

**Special Sampling Considerations**

- A clean pair of new, non-powdered disposable nitrile gloves will be worn each time a location is sampled, and the gloves should be donned immediately prior to sampling;
- Wastewater samples will typically be collected either by directly filling the sample container or by using an interim container that fills the sample container;
- During sample collection, if transferring the sample from a collection device or container, make sure the device or interim container does not come in contact with the sample containers;
- Place the samples into the appropriate, labeled containers as provided by the contract laboratory;
- All samples requiring preservation must be preserved as soon as practically possible, ideally immediately at the time of sample collection. Note: The contract laboratory will add the appropriate preservatives to the corresponding sample bottles; and
- Do not overfill sample bottles containing preservative to prevent any loss.

**Manual Sampling**

Manual sampling is normally used for collecting grab samples and/or for immediate in-situ field analyses. The best method to manually collect a sample is to use the actual sample container which will be used to transport the sample to the laboratory. This eliminates the possibility of contaminating the sample with intermediate collection containers.

If the wastewater stream cannot be physically reached by the sampling personnel or it is not safe to reach for the sample, an intermediate collection container may be used, from which the sample can be redistributed to other containers.

**ATTACHMENT 3 – Cooling Tower Blowdown (CTB) Sample Collection Procedure**

For locations where samples can be collected from a sample port, valve, or spigot, place a five-gallon bucket under the sample location and allow the sample to run for at least one minute before collection to clear the lines.

**Quality Control and Documentation**

Equipment blanks should be collected if equipment is field cleaned and re-used on-site or if necessary, to document that low-level contaminants were not introduced by the sampling equipment.

Chain of Custody forms must stay with the samples at all times and must be filled out each time sample control is transferred to another individual or entity.

**Sample Bottles and Collection**

Trace metals and organics detection limits are typically in the parts per billion (ppb or  $\mu\text{g/L}$ ), so extreme care must be exercised to ensure sample integrity. When possible, the sample should be collected directly into the appropriate sample container. If the material to be sampled cannot be physically reached, an intermediate collection device may be used.

The sample container to be analyzed may contain a preservative. Care should be taken not to flush any preservative out of the container during fill.

**Sampling Procedure**

1. Don PPE.
2. Inspect all sample bottles to ensure that they are clean and in good condition.
3. Verify all sample bottles are labeled with the appropriate preservative. Labels shall include:
  - a. Sample location;
  - b. Date;
  - c. Time;
  - d. Sampler's initials;
  - e. Requested analyses; and
  - f. Preservative type.
4. Proceed to the sample station near the Artesia WWTP Effluent Outfall to the POTW. This location is downstream of the confluence of the cooling tower blowdown (CTB) and WWTP Effluent (see map above).
5. Collect samples:
  - a. Don new, clean gloves;
  - b. Place a five-gallon bucket under the sample point to collect the flush water and any spillage;
  - c. Open the sample tap and allow the sample to run for at least one minute to flush the lines;
  - d. **NEVER** leave an open sample point unattended for any reason;

**ATTACHMENT 3 – Cooling Tower Blowdown (CTB) Sample Collection Procedure**

- e. Place each bottle under the open, running sample port. A clean, glass beaker may be used as an interim container for ease of pouring, if needed. Fill each bottle to near the top, ensuring not to overfill to retain all the sample preservative (if present);
  - f. Close the sample tap;
  - g. Tape down all sample bottle lids with electrical tape;
  - h. Place sample bottles in cooler filled with ice;
  - i. Fill glass beaker with sample for pH and temperature measurement;
  - j. Using a calibrated pH meter and probe, measure the pH and temperature of the wastewater sample and record results on the Chain of Custody form;
  - k. Fully complete the sample Chain of Custody, ensuring the COC contains:
    - i. Date;
    - ii. Time;
    - iii. Sampler's name, initials, and signature;
    - iv. Line item for each sample bottle; and
    - v. Requested analyses;
  - l. Place completed COC into plastic bag and place on top of sample inside the cooler;
  - m. Close and secure cooler lid; and
  - n. Relinquish sample to contract laboratory courier.
6. If any quantity of material has spilled onto the ground, it must be cleaned up immediately as per HFNR's spill response procedures.
7. Dispose of any material from the five-gallon bucket and excess sample in the glass beaker used in temperature and pH measurement by emptying into an approved drain. This is either the sewer box near the Talon tanks or the laboratory sink.
8. Decontaminate and triple rinse all interim sample containers and PPE used, except for nitrile gloves, which should be disposed of in an appropriate trash receptacle.
9. **If any conditions arise which would alter or prevent sampling as described in this document or if there are any questions or concerns regarding the sampling of a particular source or location, contact the HFNR Supervisor immediately for further guidance prior to performing sampling.**

**END OF PROCEDURE**

RE: HollyFrontier Navajo Refining LLC / Artesia Refinery / Renewable Diesel & Pretreatment Unit Projects /Response to OCD Request for Proposal on Potential Amendment of Discharge Permits for Four Class I Non-Hazardous Waste Injection Wells

Dear Mr. Goetze:

In response to Ms. Leigh Barr's September 24, 2021 letter regarding the Oil Conservation Division's ("OCD") jurisdictional authority pertaining to the Renewable Diesel Unit ("RDU") and Pretreatment Unit ("PTU") projects at the HollyFrontier Navajo Refining LLC ("Navajo") facility, Navajo acknowledges OCD's conclusion that the RDU and PTU fall under OCD's jurisdiction. As requested in the last paragraph of the September 24, 2021 OCD transmittal, this letter serves as a formal response to OCD's request for proposal regarding the potential amendment of Navajo's current Class I Non-Hazardous Waste Injection Well Discharge Permits UICI-8-1, UICI-8-2, UICI-8-3, and UICI-8-4. Navajo intends to discharge treated RDU wastewater to the four underground injection control ("UIC") wells (WDW-1, WDW-2, WDW-3, and WDW-4) currently regulated by these permits following treatment at Navajo's on-site wastewater treatment plant ("WWTP") in the same manner as effluent already discharged from the refinery (*i.e.*, treated effluent from the WWTP can go to any or all wells depending on refinery/RDU needs). There will be no discharge of treated PTU wastewater to any of these wells as all PTU effluent will be discharged to the City of Artesia's Publicly Owned Treatment Works (POTW) via a new discharge permit with the City.

**Background**

As presented in detail in the June 11, 2021 Navajo letter to OCD, in addition to current petroleum refining operations, the HollyFrontier organization is in the process of constructing and will operate a 9,000 barrel per day ("bpd") Renewable Diesel Unit, *i.e.*, a renewable diesel production facility, and a 13,000 bpd Pretreatment Unit to treat certain feedstocks for the RDU. Drawing 2, Water Flow Diagram, is reproduced from this letter herein to show wastewater

streams currently anticipated to be generated in connection with operations of the RDU and PTU.

- RDU process wastewater will be routed for treatment through the Refinery WWTP and will be discharged consistent with the current discharge configuration at the Refinery, including to the City of Artesia's POTW and to the Refinery's four permitted UIC wells. Since current Refinery WWTP capacity will be sufficient to treat the additional RDU wastewater stream (i.e., approximately 30 gpm discharged to the City POTW), any corresponding increase in constituent concentrations will be reduced via treatment such that Navajo will be able to maintain compliance with current federal, state and local concentration effluent limitations as well as current limitations set forth in Discharge Permits UICI-8-1, UICI-8-2, UICI-8-3, and UICI-8-4.
- A new Cooling Tower ("CT") will be installed to provide cooling for the RDU. RDU CT blowdown (approximately 30 gpm) will normally be routed to combine with the Refinery CT blowdown stream that is directly discharged to the POTW (and not the UIC wells). As shown on Drawing 2, in the event of an emergency condition, the RDU CT blowdown can be rerouted to the Refinery's onsite WWTP, for ultimate discharge to the City POTW and/or to the Refinery's UIC well network (consistent with current discharge permit levels).
- All process wastewater from the PTU (approximately 90 gpm) will be collected and routed to a new PTU wastewater treatment plant (the "PTU WWTP") for treatment prior to discharge to the City POTW via a newly permitted outfall. There is no planned discharge of PTU WWTP wastewater to the Refinery WWTP, and, therefore, no planned discharge to the UIC well network.
- A new CT will be installed to provide cooling for the PTU and the PTU WWTP. There is no planned discharge of PTU CT blowdown (approximately 30 gpm) to the UIC well network.
- PTU and rail loading/unloading areas have been designed to minimize stormwater exposure; however, a small volume of contact stormwater from these areas is expected. This contact stormwater will be collected and routed to the PTU WWTP for treatment and subsequent discharge to the POTW sewer and will not be discharged to the UIC well network.

#### **UICI Regulation and Permitting**

The RDU wastewater stream will constitute a small component of the combined RDU/Refinery process wastewater stream prior to treatment and discharge to the UIC well network. Due to the small RDU wastewater contribution and preliminary estimates of the RDU wastewater stream quality (i.e., prior to treatment), it is anticipated that the current Refinery WWTP capacity will be sufficient to treat the additional RDU wastewater stream. Therefore, Navajo is expected to

maintain compliance with current limitations and requirements set forth in Discharge Permits UICI-8-1, UICI-8-2, UICI-8-3, and UICI-8-4.

For the PTU wastewater stream, including the PTU CT blowdown, there will be no anticipated discharge of PTU wastewaters to the UIC well network, and as a result, there will be no effect from the PTU on Discharge Permits UICI-8-1, UICI-8-2, UICI-8-3, and UICI-8-4.

Given that the RDU wastewater stream will not change the current flow and concentration characteristics of the Refinery WWTP discharge to the UIC well network (as well as the fact of no wastewater contribution from the PTU discharge to the UIC well network), the RDU/PTU projects will not affect the current terms of the four UICI Discharge Permits. In other words, effluent discharge quantity (flow), quality (concentrations), or injection pressure are not expected to increase from current permitted limits/levels. These discharge characteristics, currently reported by Navajo on a quarterly basis, will remain the same once the RDU/PTU is online; summaries for wells WDW-1, WDW-2, WDW-3, and WDW-4 from January 1, 2021 to September 30, 2021 are given in Tables 1 and 2 as a reference.

Navajo has reviewed all provisions of the four December 2017 Class I Non-Hazardous Waste Injection Well Discharge Permits and cannot identify any amendments/changes that need to be made to accommodate the RDU/PTU discharge. The addition of RDU/PTU activities will not alter the operation, maintenance, or monitoring of the four underground injection wells. Therefore, Navajo believes that permit modifications for the existing UICI Discharge Permits are not necessary at this time. As a result, and subject to OCD concurrence, Navajo proposes that the current UICI Discharge Permits be maintained in their entirety until their December 2022 expiration, given that the RDU/PTU projects come online prior to this date.

Please let us know if you would like to discuss the above response and/or would like additional information. We look forward to your feedback and thank you in advance for your consideration.

Sincerely,

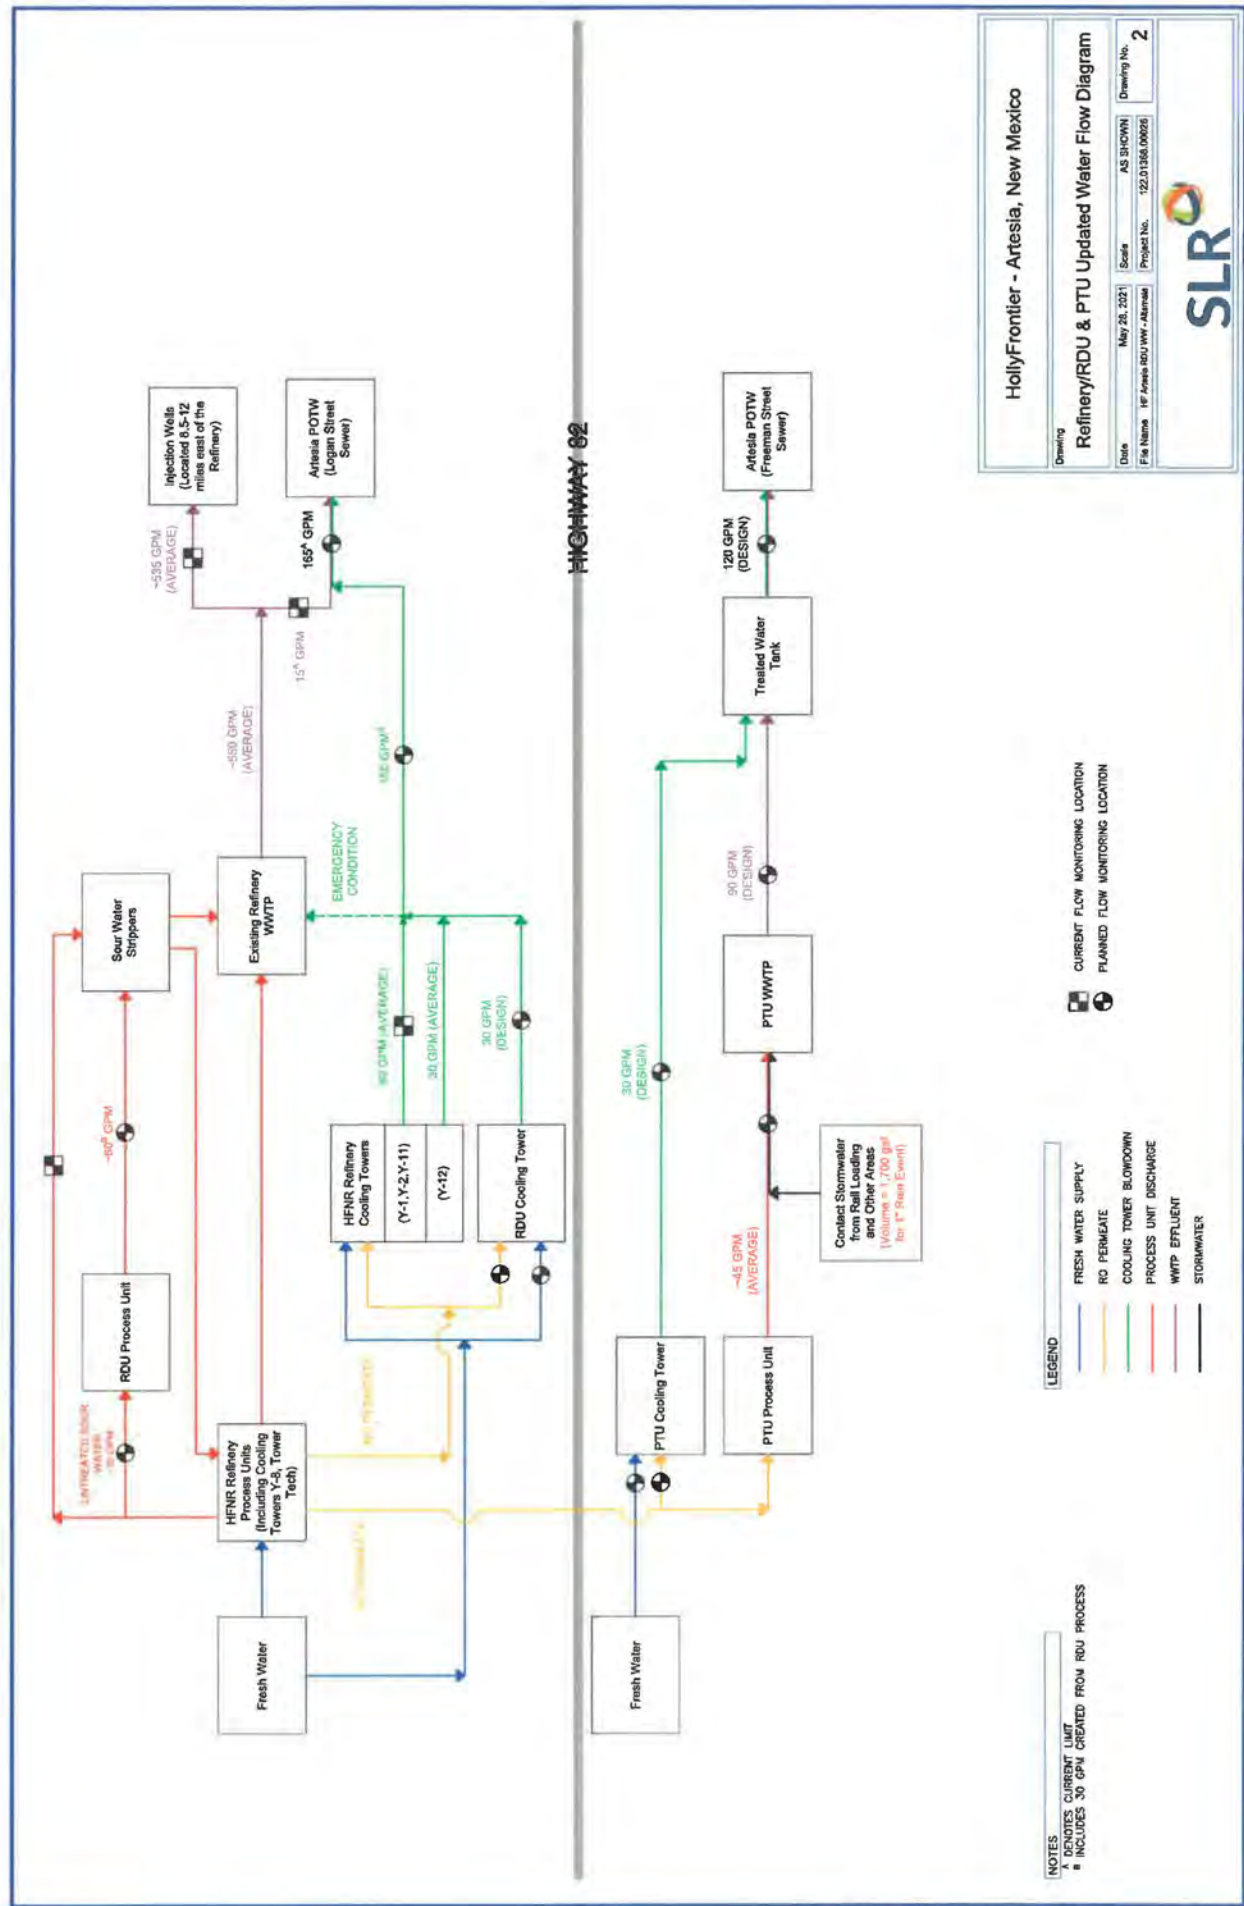

Kawika Tupou  
Environmental Manager

Phil/Carl – I wanted to share some research we had done previously on RDUs in the US. After our call I updated as it sounded like y'all were planning on doing some research. I haven't found any that use UICs – they all discharge to CWA-permitted systems. Feel free to call with any questions. Thanks,  
Mike

Known Renewable Diesel Facilities

Original list based on google research available; 4Aug20 updated 12/10/21

Facility	Location	Notes	Wastewater Discharge Location	Info Sources
REG Renewable Energy Group (REG Geismar)	Geismar, LA	has several facilities, but only 1 produces renewable diesel; proprietary BioSynfining production technology, has a PTU	LPDES Permit for direct discharge to Mississippi River	<a href="https://www.fool.com/investing/2019/09/06/heres-why-renewable-energy-group-should-go-all-in.aspx">https://www.fool.com/investing/2019/09/06/heres-why-renewable-energy-group-should-go-all-in.aspx</a>
AlkAir Fuels (Owned by World Energy LLC aka Paramount Petroleum Refinery)	Paramount, CA	Will have PTU. Upgrading RFU, adding additional RFU. Upgrade to WWTP. Previously was Paramount Petroleum, some info on EPA ECHO. Unclear if NPDES Permit still active, if facility has completed conversion from refinery to renewable diesel. To begin production early 2023. As per the EIS, Sec 4.5,	project not expected to discharge to Water of the US (no NPDES Permit). Discharge treated wastewater to City POTW.	<a href="https://www.ogj.com/refining-processing/refining/article/14203258/altair-paramount-advances-california-renewable-fuels-refinery-plan">https://www.ogj.com/refining-processing/refining/article/14203258/altair-paramount-advances-california-renewable-fuels-refinery-plan</a> <a href="https://paramountenvironment.org/world-energy-converts-paramount-refinery-to-renewable-fuels/">https://paramountenvironment.org/world-energy-converts-paramount-refinery-to-renewable-fuels/</a>
Diamond Green Diesel ("DGD")(Valero and Darling Ingredients)	Norco, LA	Largest US producer, co-located within Valero Facility	discharges process-related wastewaters to Pretreatment WWTP then to Valero WWTP. Other utility waters, stormwater, non-process area waters direct discharge	
Valero Refinery	New Orleans, LA	receives Diamond Green process wastewater	Direct discharge via NPDES Permit	F5 pg 6 mentions pretreatment of DGD process waters include gravity separation, pH adjustment, equalization, DAF, bio treatment
Sinclair Wyoming Refining	Sinclair, WY	Unit in operation, runs Soybean oil only. They don't have a PTU.	Zero discharge facility, previously routed wastewater into their refinery Sour Water system.	EPA ECHO database
Sunshine Biofuels	Lake Worth, FL	no info on EPA ECHO	no info	<a href="http://gosunshinebiofuel.com/renewable-diesel-biofuel/">http://gosunshinebiofuel.com/renewable-diesel-biofuel/</a>
Jaxon Energy	Jackson, MS	small facility, no PTU	no info	no website, may be under different name?
Neste	none in US	Largest global producer, no US facilities, provides imports to CA	no info	
Marathon Martinez Renewable Fuels	Martinez, CA	PTU and RDU. converting idled refinery; construction expected Fall 2021 with expected online 2022.	Will have NPDES Permit and "Industrial waste Discharge Permit" from EPA. Current NPDES Permit expired in 2020; admin extended (Order # R2-2015-0033)	<a href="https://www.marathonmartinezrenewables.com/Newsroom-1/Marathon-Petroleum-Corp-Martinez-Renewable-Fuels-project-advances-in-permitting-process/">https://www.marathonmartinezrenewables.com/Newsroom-1/Marathon-Petroleum-Corp-Martinez-Renewable-Fuels-project-advances-in-permitting-process/</a>
Ryze, Renewables	Las Vegas, NV	IN CONSTRUCTION	no info	<a href="http://www.biodieselmagazine.com/articles/2517318/renewable-diesels-rising-tide">http://www.biodieselmagazine.com/articles/2517318/renewable-diesels-rising-tide</a>
Phillips66 Rodeo Renewable	Rodeo, CA (near Marathon CA facility)	PTU; convert existing refinery to renewable diesel to be completed in 2024.	Discharge via NPDES Permit to off-shore.	<a href="https://www.contracosta.ca.gov/DocumentCenter/View/69279/LP20-2040_NOP">https://www.contracosta.ca.gov/DocumentCenter/View/69279/LP20-2040_NOP</a>
CVR Energy Wynnewood	Wynnewood, OK	IN CONSTRUCTION: converting refinery to make renewable diesel and naphtha. 100 Mmgy facility, to be completed in April 2022. Will have PTU to use corn oil and soybean oil.	Discharges wastewater under NPDES Permit to receiving stream	<a href="http://www.biodieselmagazine.com/articles/2517318/renewable-diesels-rising-tide">http://www.biodieselmagazine.com/articles/2517318/renewable-diesels-rising-tide</a>
CVR Coffeyville	Coffeyville, KS	150 Mmgy renewable diesel facility; covert current refinery. No timeline on project.	NPDES Permit for discharge to pond system then direct discharge to river	<a href="http://biomassmagazine.com/articles/18449/cvr-to-move-forward-with-wynnewood-conversion-in-early-2022">http://biomassmagazine.com/articles/18449/cvr-to-move-forward-with-wynnewood-conversion-in-early-2022</a>
Bakersfield Renewable Fuels	Bakersfield, CA	IN CONSTRUCTION: will make renewable diesel, liquid propane and naphtha. Commissioned in early 2022 and produce 230 Mmgy.	no info	<a href="http://www.biodieselmagazine.com/articles/2517318/renewable-diesels-rising-tide">http://www.biodieselmagazine.com/articles/2517318/renewable-diesels-rising-tide</a>
Crimson Renewable Biodiesel	Bakersfield, CA	Biodiesel facility and not RDU.	no info	<a href="https://www.energy.ca.gov/showcase/driving-cleaner-transportation/crimson-renewable-biodiesel-project">https://www.energy.ca.gov/showcase/driving-cleaner-transportation/crimson-renewable-biodiesel-project</a>

Marathon Petroleum	Dickinson, ND	No PTU. Start-up in late 2020.	Facility discharges to City of Dickinson POTW.	<a href="https://deq.nd.gov/PublicComment/NDPDES-Marathon-20200411.pdf">https://deq.nd.gov/PublicComment/NDPDES-Marathon-20200411.pdf</a>
To be constructed:				
REG/Phillips66	WA	as per REG website, this facility produces biodiesel, not renewable diesel	no info	<a href="https://www.biofuelsdigest.com/bdigest/2019/04/22/renewable-diesel-is-a-game-changer-for-sustainable-aviation-and-low-carbon-fuel-markets-in-the-u-s-canada-europe-and-southeast-asia/">https://www.biofuelsdigest.com/bdigest/2019/04/22/renewable-diesel-is-a-game-changer-for-sustainable-aviation-and-low-carbon-fuel-markets-in-the-u-s-canada-europe-and-southeast-asia/</a>
NEXT Renewable Fuels	Port Westward, OR	Proposed facility	ODEQ website indicates plans to discharge wastewater to Port of Columbia County WTP	<a href="https://www.oregon.gov/deq/Programs/Documents/NEXTPublicInfoMpres.pdf">https://www.oregon.gov/deq/Programs/Documents/NEXTPublicInfoMpres.pdf</a>
Phillips66/Ryze Renewables	Reno, Las Vegas, NV	2 facilities, currently under construction, no PTU	no info	<a href="https://hyzerenewables.com/facilities.html">https://hyzerenewables.com/facilities.html</a>
