## 1. Introduction

This report summarizes groundwater monitoring and remediation activities conducted during the second half 2022 at the Former Lee Gas Plant (Site) in Lea County, New Mexico (Figure 1). Tasman Geosciences, Inc. (Tasman) performed these activities on behalf of DCP Midstream, LP (DCP). The field activities described herein were conducted with the purpose of monitoring groundwater flow and quality conditions and assessing the presence of light non-aqueous phase liquid (LNAPL) hydrocarbons in the Site subsurface. Current Site conditions were evaluated from field data and analytical laboratory results collected between December 12 - 14, 2022. The data collected was used to develop the groundwater elevation maps and analytical results figure presented herein.

## 2. Site Location and Background

The Site is located in the southwest quarter of the southeast quarter of Section 30, Township 17 South, Range 35 East, approximately 0.45 miles southeast of the intersection of US Highway 238 and County Road 50. The approximate field coordinates are 32.800 degrees north and 103.495 degrees west. The area is sparsely populated, and land use is primarily associated with livestock grazing and oil and gas production and gathering.

Based on review of historical reports from previous Site investigations, the Site was historically used as a gas processing and compression plant. In 1988, Phillips 66 Natural Gas Company was ordered to install four monitoring wells (MW-1 through MW-4) in accordance with the Resource Conservation and Recovery Act (RCRA). An initial groundwater sampling event took place May 13, 1988, and identified impacts in the location of two former evaporation ponds north and east of the main plant. LNAPL was identified immediately above the water table at an approximate depth of 106 feet below ground surface (bgs). Several additional subsurface investigations were performed to determine the extent of both the free and dissolved phase hydrocarbon plumes, resulting in the installation of monitoring and recovery wells as described below:

- MW-5 through MW-8 and RW-1: Installed May 1990 – LNAPL recovery initiated at RW-1.
- MW-9 through MW-12: Installed October 1990.
- MW-13 and MW-14: Installed March 1991 – MW-7, MW-8, and MW-10 were converted into recovery wells.
- MW-15 through MW-20: Installed February 1992.

Subsequent to installation of the final six wells, quarterly groundwater sampling commenced. In addition, a soil vapor extraction (SVE) and air sparge (AS) system operated between 1993 and 2004. Currently, Site groundwater monitoring wells are sampled on a semi-annual basis.

Due to continued LNAPL detections at MW-15, a Magnum Spill Buster automatic LNAPL recovery system was installed on September 14, 2013, to address LNAPL at this location. Current Site remediation activities are further detailed in Section 4.0.

### 3. Groundwater Monitoring

This section describes the groundwater field and laboratory activities performed during the second half 2022 monitoring events from December 12<sup>th</sup> through 14<sup>th</sup>, 2022. Monitoring activities included Site-wide groundwater gauging, LNAPL measurements, and groundwater sampling. Figure 2 illustrates the groundwater monitoring well network utilized to perform these activities at the Site.

#### 3.1 Groundwater Monitoring and LNAPL Thickness

Depth to groundwater, later converted to elevation, and LNAPL thickness was measured to evaluate hydraulic characteristics and provide information regarding seasonal and annual fluctuations in groundwater elevations at the Site. During the second half of 2022, groundwater levels were measured at 23 monitoring well locations. LNAPL was detected in the following monitoring wells during the second half 2022 monitoring event, with the measured thickness indicated in parenthesis:

- Second Half 2022
  - MW-5 (0.32 feet)
  - MW-15 (0.06 feet)

Groundwater and LNAPL levels were measured on the north side of the well casing to the nearest 0.01-foot using an oil-water interface probe (IP). Groundwater level data was later converted to elevation (feet above mean sea level [AMSL]). Measured groundwater levels, calculated groundwater elevations, and LNAPL level data are presented in Table 1.

A second half 2022 groundwater elevation map, included as Figure 3, indicates that groundwater flow at the Site trends to the southwest. Groundwater elevations ranges, average elevation changes from previous monitoring events, and calculated hydraulic gradients (using elevations from MW-3 and MW-20) at the Site are summarized in the table below.

**Summary of Measured Hydraulic Parameters**

<b>Second Half 2022 (12/12/2022)</b>	
Maximum Elevation (Well ID)	3,872.48 (MW-3)
Minimum Elevation (Well ID)	3863.97 (MW-14)
Average Change from Previous Monitoring Event (ft) – All Wells	-0.48
Hydraulic Gradient (ft/ft) / (Well IDs)	0.0072 (MW-3 to MW-20)

\*MW-14 was not included in gradient calculation or potentiometric surface

#### 3.2 Groundwater Quality

Subsequent to recording groundwater level measurements, groundwater samples were collected from 10 monitoring wells at the Site. A minimum of three well casing volumes of groundwater was purged from each monitoring well prior to collection of groundwater samples. Following well purging activities utilizing

a mechanical pump, groundwater samples were collected using disposable polyethylene bailers, placed in clean laboratory-supplied containers for the selected analytical methods, packed in an ice-filled cooler, and maintained at approximately four (4) degrees Celsius (°C) for transportation to the laboratory. Groundwater samples were shipped under chain-of-custody procedures to Pace Analytical labs (Pace) in Mt. Juliet, Tennessee for analysis. Water quality samples were submitted for analysis of benzene, toluene, ethylbenzene, and total xylenes (BTEX) by United States Environmental Protection Agency (USEPA) Method 8260B.

Monitoring well MW-15 with an active Spill Buster LNAPL recovery system was not sampled, due to the presence of LNAPL. Monitor wells MW-6 and MW-8 were dry and not sampled during the monitoring event. Wells MW-1, MW-2, MW-3, MW-4, and MW-23 have been removed from the groundwater monitoring program due to a lack of groundwater at these locations. Monitor wells MW-7, MW-12, and MW-14 contained insufficient volume for sample collection. A sample could not be collected from MW-13 during the reporting period, because of an obstruction near the top of the water table. Attempts to clear the obstruction were unsuccessful, it is presumed that the well casing is damaged.

Table 2 summarizes BTEX concentrations in groundwater samples collected during the reporting period. Analytical results from the second half 2022 monitoring event are displayed on Figure 4. Historical analytical results up to and including the December 2022 event are included in Appendix A. The laboratory analytical report for the second half 2022 event is included in Appendix B.

Benzene was detected at concentrations greater than the New Mexico Water Quality Control Commission (NMWQCC) groundwater standard of 0.005 milligrams per liter (mg/L) at the following monitoring well locations:

- Second Half 2022
  - MW-9 – 1.58 mg/L
  - MW-10 – 22.2 mg/L; (24.4 mg/L Duplicate)
  - MW-11 – 0.0325 mg/L
  - MW-21 – 13.3 mg/L; (13.0 mg/L Duplicate)

Ethylbenzene was detected above NMWQCC groundwater standard of 0.70 mg/L in monitor well MW-21 (1.58 mg/L) and its duplicate (1.55 mg/L), with a lab result of 1.55 mg/L. All other samples collected had BTEX concentrations below applicable NMWQCC groundwater standards and/or laboratory reporting detection limits (RDL).

### 3.3 Data Quality Assurance / Quality Control

Data quality assurance / quality control (QA/QC) procedures included the collection and analysis of QA/QC samples, as well as a review of laboratory analytical data for QA/QC compliance. Specifically, the following QA/QC procedures were conducted: a trip blank was collected and submitted for analysis; field duplicate samples from wells MW-10 and MW-21 were collected and submitted for analysis; and laboratory data were reviewed for compliance with the analytical method(s) and the associated QA/QC procedures.

An evaluation of the QA/QC procedures conducted during the second half 2022 groundwater monitoring

events indicated the following:

- Toluene was detected in the trip blank above the reported detection limit (RDL) but below the method detection limit (MDL) resulting in an estimate value, or “J” flag.
- During the second half 2022 groundwater monitoring event, MW-10 and the associated duplicate sample exhibited benzene concentrations of 22.2 mg/L and 24.4 mg/L, respectively. The calculated relative percent difference (RPD) for benzene between the samples was 9.4%, which is within the target control range of 20%. Monitoring well MW-21 and its duplicate exhibited benzene concentrations of 13.3 mg/L and 13.0 mg/L, respectively, which yielded an RPD of 2.3%, which is within the target control range of 20%. Submitted samples were analyzed using the correct analytical methods and within the correct holding times.
- Chain of custody forms were in order and properly executed.
- Data was reported using the correct method number and reporting units.

The overall QA/QC assessment of the second half 2022 data indicates that both field precision and overall data precision and accuracy are acceptable.

## 4. Remediation Activities

Measurable free phase hydrocarbons were detected during the reporting period in monitoring wells MW-5 and MW-15 as summarized in Tables 1 and 2. LNAPL recovery at MW-15 was initiated on September 14, 2013 (second half 2013) using a Magnum Spill Buster automatic LNAPL recovery system. Details regarding Spill Buster implementation were described in the second half 2013 Report.

Since LNAPL recovery was initiated at MW-15, the Spill Buster system has removed a cumulative total of more than 535 gallons of LNAPL through June 2022. The extracted LNAPL material is disposed of at the Eunice, New Mexico disposal facility. During a September visit to the site the Spill Buster pump was found to be malfunctioning. No recovered product was observed within the recovery tank. The unit was repaired and returned to service. During the December monitoring event no product was observed in the recovery tank, likely due to an insufficient volume of LNAPL at monitor well MW-15.

### 4.1 LNAPL Extraction

As described in Section 4, LNAPL extraction has been conducted at the Site using automatic recovery methods. The extracted volume by the Spill Buster at MW-15 indicates that the Spill Buster technology is appropriate for continued operation at the Site and that the geology is amenable to moderate LNAPL removal given the appropriate conditions.

LNAPL extraction will be continued and/or expanded during 2022 as follows:

- Passive LNAPL Recovery Bailers:
  - Passive LNAPL recovery bailers are deployed at MW-5 and MW-6 to allow continued collection of LNAPL in between field events. This remedial effort is contingent on a sufficient water column within the well to accommodate the bailer's LNAPL collection reservoir and allow the influent filter/collection point of the bailer to sit at the

LNAPL/water interface. Elevation data collected during the monitoring event and the lack of recovered product in the passive bailers indicates that sufficient water column was not present during the second half 2022.

- Solar-Powered Spill Buster:
  - Continue operation of the Spill Buster at MW-15. Removal volumes will be monitored over time to observe changes in the thickness or yield of LNAPL at that location.

## 5. Conclusions

The second half 2022 monitoring data with historical information provides the following general observations:

- Based on historical groundwater elevations, the potentiometric surface has remained relatively stable, however, most Site wells have exhibited a decreasing trend in groundwater elevation since 2015. The observed trend has resulted in a combined average decrease of 1 to 2-feet in elevation since 2015.
- BTEX concentrations throughout the Site continue to fluctuate when compared to historical data.
- Benzene concentrations have remained elevated, but relatively steady, at MW-10 since 2010.
- At MW-12, benzene concentrations historically fluctuated since 2012 and remain above the NMWQCC standard.
- LNAPL persists at monitoring well location MW-15. At MW-15, LNAPL is being addressed with the Spill Buster LNAPL extraction system. Prior to the current reporting period, MW-8 had either contained LNAPL or been dry each event since 2006 (see Appendix A). If MW-8 contains sufficient sample volume and if measurable LNAPL is not present during the first half 2023 sampling event, a groundwater sample will be collected.

## 6. Recommendations

Based on evaluation of first half 2022 and historical Site observations and monitoring results, the following recommendations have been developed for future activities:

- Continue semi-annual groundwater sampling to monitor dissolved and free phase petroleum hydrocarbons and assess the effectiveness of the current remedial strategy for the Site. Samples will be collected from locations illustrated on Figure 2 and which have historically been included in the sampling plan.
- Continue operation and maintenance of the Spill Buster LNAPL recovery system at MW-15 to address free phase petroleum thicknesses in the northern area of the Site.
- Due to supply issues, the installation of additional spill buster or LNAPL recovery system at MW-5 and MW-6 to address the free phase petroleum thicknesses in the northern area adjacent to MW-15 as previously proposed in the *First Half 2022 Groundwater Monitoring Summary Report* will need to be postponed for the foreseeable future. An update will be provided to NMOCD when a status change is made available.

Average change in groundwater elevation (12/16/21 to 6/22/22)								-0.76

Notes:

1- Changes in groundwater elevation calculated by subtracting the measurement collected during the previous monitoring event from the measurement collected during the most recent monitoring event.

2- TOC elevations for MW-1, MW-2, MW-21, MW-22, and MW-23 were calculated relative to the historical MW-7 TOC elevation based on a transit survey conducted on 6/4/14.

amsl = feet above mean sea level

TOC = top of casing

Groundwater elevation = (TOC Elevation - Measured Depth to Water)

\* Groundwater elevation was corrected for product thickness using the following calculation, when applicable:

Groundwater elevation = (TOC Elevation - Measured Depth to Water) + (LNAPL Thickness in Well \* LNAPL Relative Density)

LNAPL relative density is assumed to be approximately 0.75

\*\* Monitoring well MW-15 has an active Spill Buster automatic LNAPL recovery pump installed. As such, the calculated groundwater elevations may not be representative of actual groundwater elevations within the well.

NM = Not Measured

NA = Not Applicable

Notes:

**Bold red** values indicate an exceedance of the associated NMWQCC standard (Effective 7/1/2020) or, for chlorides, the secondary maximum contaminant has been established as a guideline in the National Secondary Drinking Water Regulations.

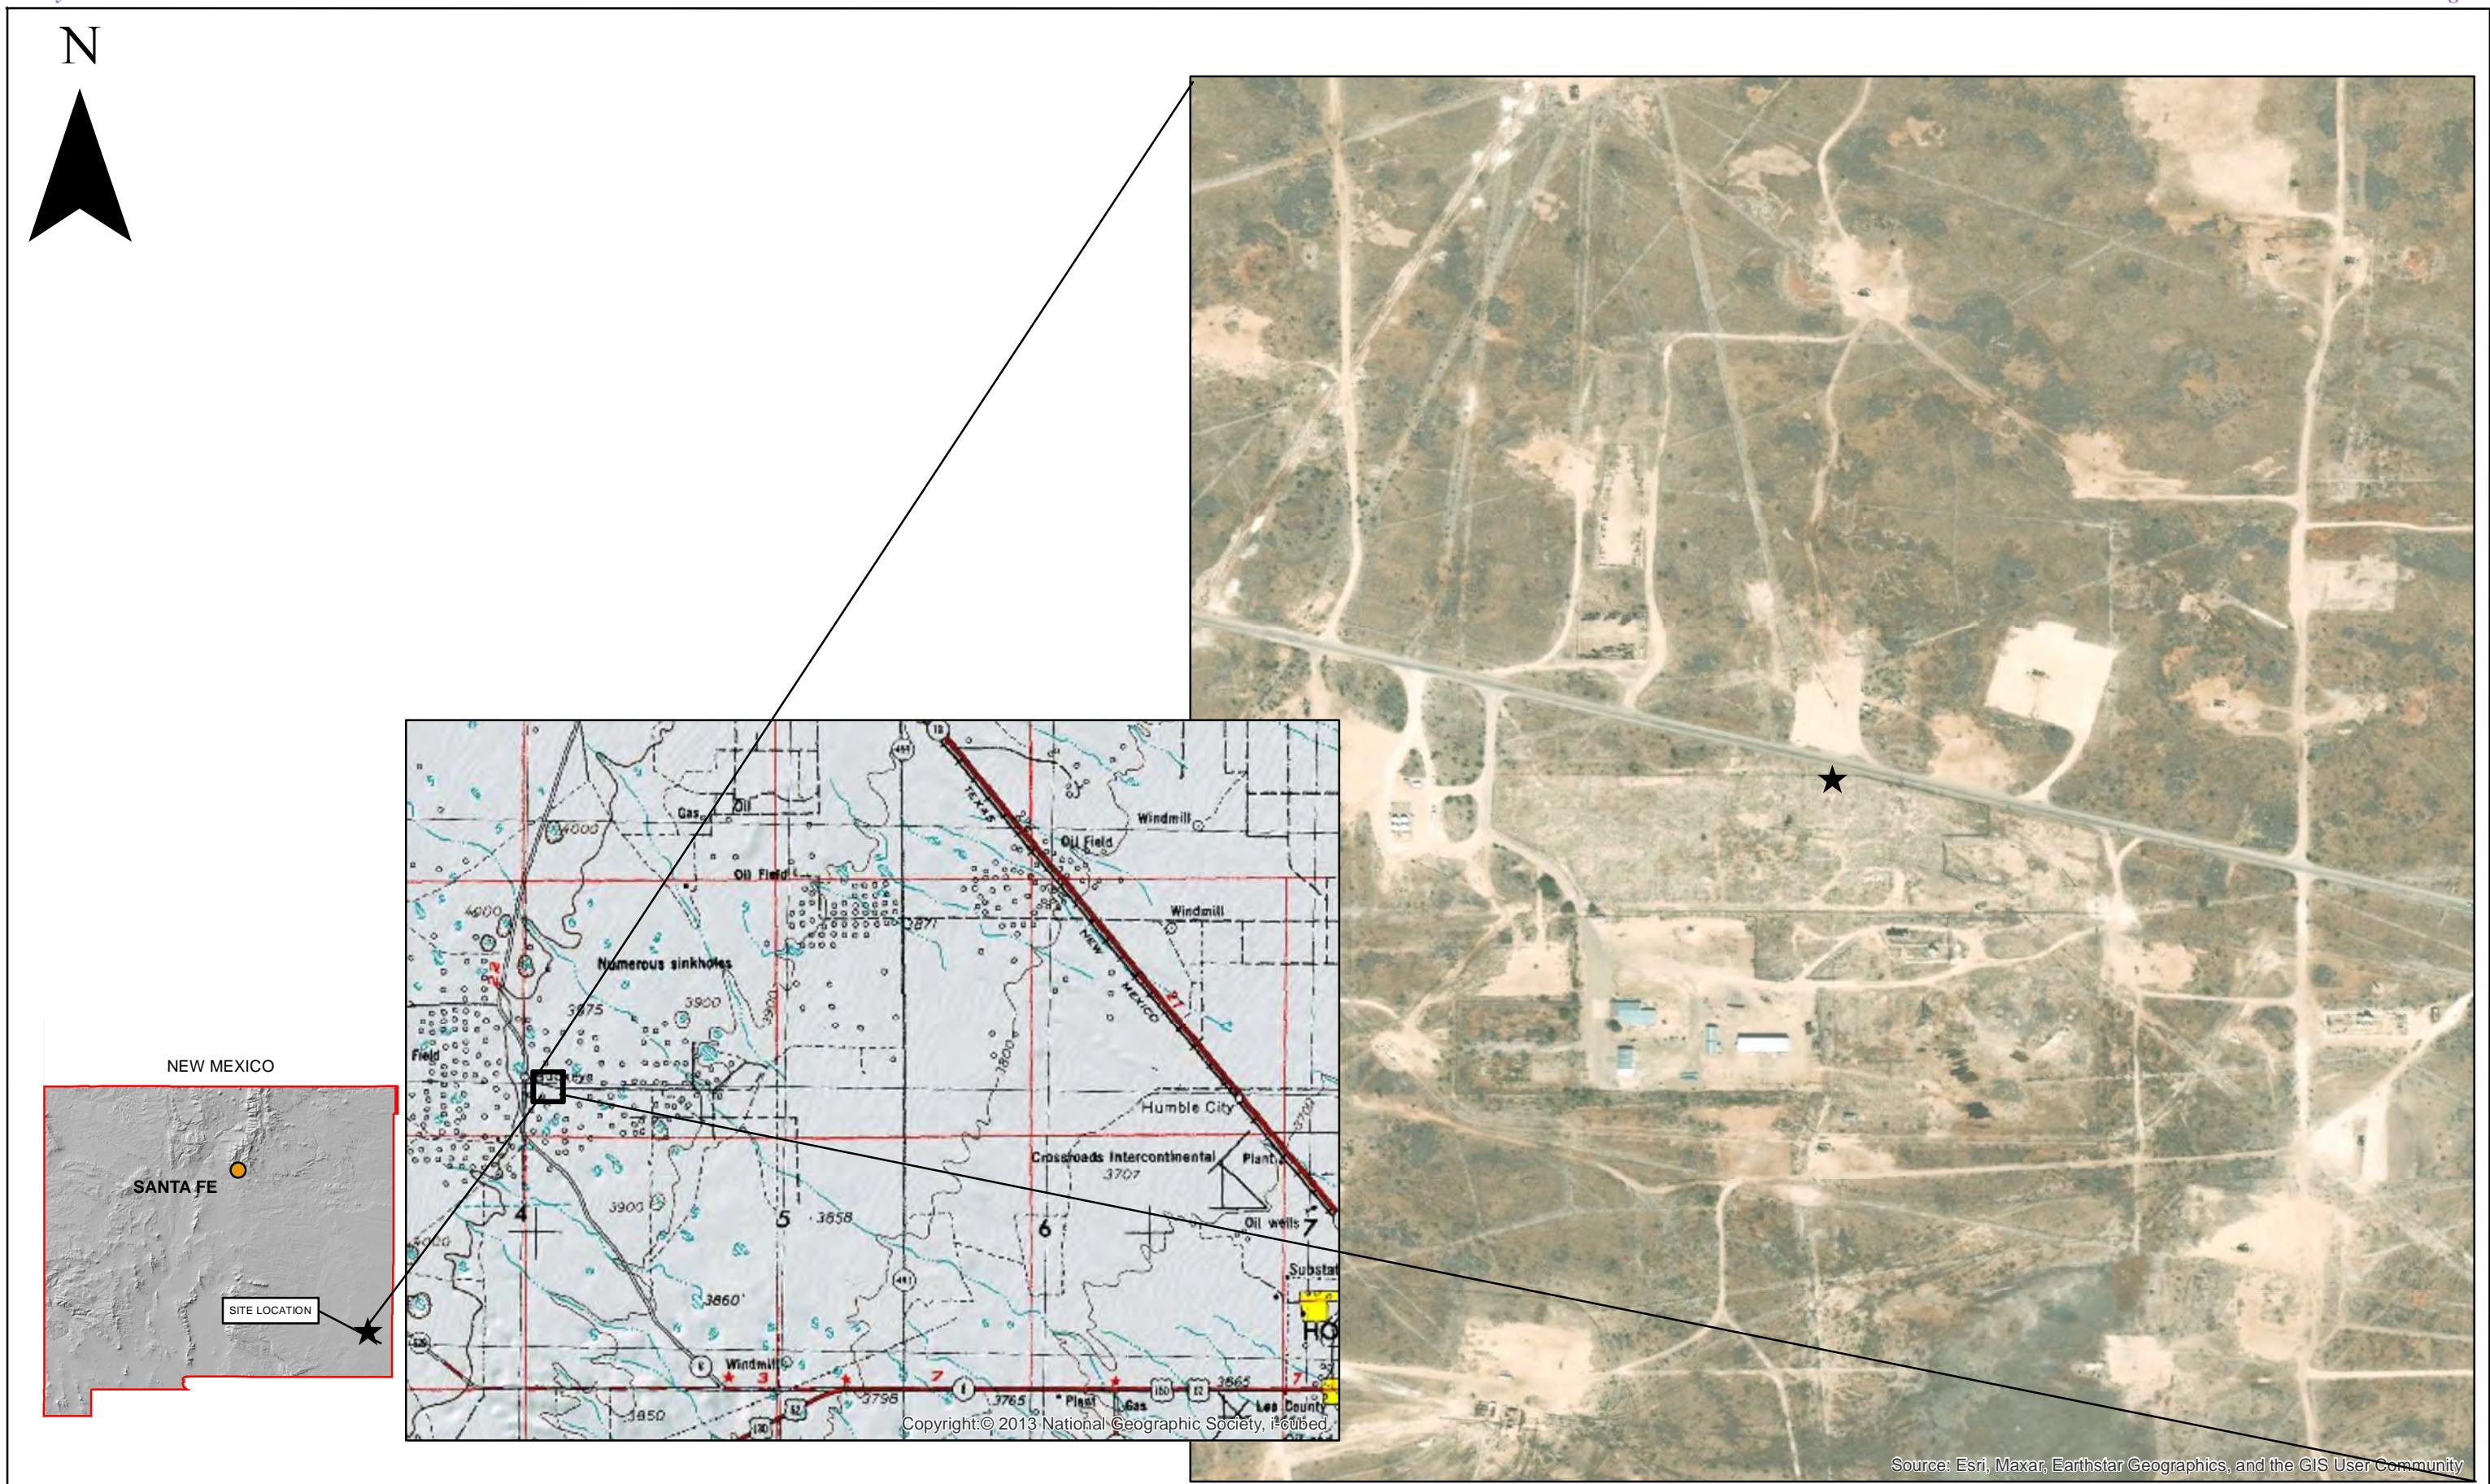

NMWQCC = New Mexico Water Quality Control Commission

LNAPL = Light Non-Aqueous Phase Liquid

J = A qualifier indicating an estimated value of a concentration above the laboratory's Method Detection Limit (MDL) but below the Reported Detection Limit (RDL).

mg/L = milligrams per liter

Notes:

**Bold red** values indicate an exceedance of the NMWQCC groundwater standards for the Site.

NMWQCC = New Mexico Water Quality Control Commission

LNAPL = Light Non-Aqueous Phase Liquid

B = A qualifier indicating an analyte was detected in both the sample and the associated Method Blank (MB)

J = A qualifier indicating an estimated value of a concentration above the laboratory's Method Detection Limit (MDL) but below the Reported Detection Limit (RDL).

NS = Not Sampled

NA = Not Analyzed

mg/L = milligrams per liter

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

## Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

**Results Disclaimer -** Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

### Abbreviations and Definitions

MDL	Method Detection Limit.	<sup>1</sup> Cp
RDL	Reported Detection Limit.	<sup>2</sup> Tc
Rec.	Recovery.	<sup>3</sup> Ss
RPD	Relative Percent Difference.	<sup>4</sup> Cn
SDG	Sample Delivery Group.	<sup>5</sup> Sr
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.	<sup>6</sup> Qc
U	Not detected at the Reporting Limit (or MDL where applicable).	<sup>7</sup> Gl
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.	<sup>8</sup> Al
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.	<sup>9</sup> Sc
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.	
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.	
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.	
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.	
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.	
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.	
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.	
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.	
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.	

Qualifier	Description
J	The identification of the analyte is acceptable; the reported value is an estimate.
