**Re: Stage 2 Abatement Plan (AP) for the Former Reverse Osmosis (RO) Reject Discharge Fields at the HF Sinclair Navajo Refining LLC (HFSNR)  
Quarterly Status Report #5 – July through September 2025  
Incident #nRM2022559242, GW-028**

Dear Mr. Chang:

HF Sinclair Navajo Refining LLC (HFSNR) is submitting this quarterly status report number 5 for the Stage 2 Abatement Plan (AP) for the Former Reverse Osmosis (RO) Reject Discharge Fields (RO Fields) at the HF Sinclair Navajo Refining LLC (HFSNR) Refinery (Refinery) located in Artesia, New Mexico (**Figure 1**). The Oil Conservation Division (OCD) approved the Stage 2 AP on July 11, 2024. The former RO Fields are located within the northern portion of the active Refinery (**Figure 2**).

This quarterly status covers the period of July through September 2025.

#### **Work Performed During July through September 2025**

July 2025:

- July 1 to 10: Planting continued and was completed on July 10.
- July 1 through 22: Irrigation of the fields continued. Optimization of the irrigation system was conducted to allow the irrigation system to run 24 hours and minimize the number of days to complete irrigation of each field.
- July 22 to 24: Mowing of weeds was conducted to remove / reduce weed growth, specifically along the edges of the fields and in the northern portion of the North RO Field.
- July 22: Two irrigation valves were damaged by the mowing operations in the North RO Field. The damage resulted in the inability to irrigate this field while repairs were made to the valves.
- July 23 to 31: Irrigation of the South RO Field continued.

August 2025:

- August 1 to 2: Repairs were made to the two irrigation valves in the North RO Field. Irrigation of the South RO Field continued.

HF Sinclair Navajo Refining LLC  
501 East Main, Artesia, NM 88210  
575-748-3311 | [HFSinclair.com](http://HFSinclair.com)

- August 3 to 26: Irrigation continued in both fields.
- August 11: Plant counts were conducted in the South RO Field.
- August 22: Plant counts were conducted in the western half of the North RO Field.
- August 28: Plant counts were conducted in the eastern half of the North RO Field.

September 2025:

- September 22: Plant counts were conducted in both fields.
- September 24: Mowing was conducted in both fields. Two irrigation valves were damaged in the South RO Field.

#### **Work Planned for October through December 2025**

October 2025:

- Repair irrigation valves in South RO Field.
- Collect plant samples and perform laboratory analyses of constituents of concern.
- Develop detailed scope of work for 2026 continued pilot study.

November – December 2025:

- Evaluate whether adequate vegetation is present to warrant off-site disposal.
- Finalize 2026 scope of work and prepare implementation schedule.

#### **Evaluation of 2025 Pilot Study**

During 2025, the two fields were divided into two sections each and four separate species were planted, one per section, as follows:

- North RO field, west was planted with Western Wheatgrass “Arriba” at a rate of approximately 10 pounds of seed per acre (lb/ac).
- North RO field, east was planted with Tall Wheatgrass “Jose” at a rate of approximately 25 lb/ac in the northern third of the area and at a rate of approximately 10 lb/ac in the southern two-thirds of the area. The difference in the seed rate was due to calibration of the seeding equipment.
- South RO field, west was planted with Hybrid Sorghum “Sudangrass” at a rate of approximately 19 lb/ac.
- South RO field, east was planted with Indiangrass “Cheyenne” at a rate of approximately 15 lb/ac.

The planting operations in 2025 were not completed until July 10, 2025, which did not allow for ideal seed germination prior to the beginning of the summer heat. Damage to the irrigation valves in North RO Field inhibited irrigation operations in that field, reducing plant growth.

Plant counts were conducted in August and September 2025. **Attachment A** provides tabulated plant counts for each event as well as photologs with representative photos of the plant count activities. The observations and conclusions regarding the 2025 activities include:

- North RO Field Plant Growth Observed:
  - Tall Wheatgrass:
    - August Average: 0.4 plants per square foot (sf) with 2.8 weeds per sf, or 1 plant per 6.7 weeds
    - September Average: 0.6 plants per sf with 2 weeds per sf, or 1 plant per 3.1 weeds
  - Western Wheatgrass:
    - August Average: 1.1 plants per sf with 1.9 weeds per sf, or 1 plant per 1.8 weeds
    - September Average: 0.6 plants per sf with 1.9 weeds per sf, or 1 plant per 3 weeds
- South RO Field Plant Growth Observed:
  - Cheyenne Indiangrass:
    - August Average: 1.3 plants per sf with 3.8 weeds per sf, or 1 plant per 2.8 weeds
    - September Average: 0.8 plants per sf with 2.5 weeds per sf, or 1 plant per 3 weeds
  - Sudan Grass:
    - August Average: 5.3 plants per sf with 3.5 weeds per sf, or 1 plant per 0.7 weeds
    - September Average: 2.9 plants per sf with 2 weeds per sf, or 1 plant per 0.7 weeds
- Conclusions:
  - Planting occurred later than desired, and irrigation was not as effective as desired, resulting in lower growth of desired grasses and higher growth of weeds.
  - The seeding rate for the Tall Wheatgrass in two-thirds of the eastern field was significantly less than ideal and contributed to the lack of growth.
  - Irrigation system damage contributed to lack of growth in the North RO Field.
  - Inadequate pressure for water distribution contributed to lack of growth in South (East) RO Field.

Sudan Grass demonstrated the most successful growth; however, as an annual plant, this grass species is not expected to develop as deep a root structure as the native perennial grasses.

## 2026 Recommendations

Recommendations for 2026 pilot study activities include:

- Plow under existing vegetation during the late winter/early spring and remove any rocks or heavy roots that are exposed.
- Control weeds through the application of a pre-emergent herbicide followed by light irrigation to kill any weeds that sprout.
- Till the fields to a depth of 6 inches, approximately one week following the light irrigation, to create an even surface and provide additional weed removal in preparation for seeding the following species:
  - North RO Field:
    - Western Wheatgrass in western section
    - Saltalk Alkali Sacaton in eastern section
  - South RO Field:
    - Whiplash Papusgrass in western section
    - Cheyenne Indiangrass in eastern section
- Use a seed drill to plant the species listed above to recommended depths ranging from 0.5 to 1.5 inches below ground, at a calculated rate (pounds of seed per acre) that accounts for the percent pure live seed present in each seed bag and specific germination rate for each species, in order to achieve appropriate growth.
- Apply organic OMRI approved fertilizer following initial seeding. Ensure that planting is complete no later than mid-May to avoid heat.
- Improve irrigation activities by:
  - Installing a sixth rolling irrigation system in the southwestern portion of the South RO Field; and
  - Beginning irrigation within five days of seeding, unless rainfall occurs.
- Apply additional synthetic fertilizer based on plant growth evaluations throughout growing season.

A separate letter will be submitted to OCD providing additional details and background information for the above recommendations for 2026 activities.

**Closing**

If you have any questions, please feel free to contact Teresa Alba at 575-746-5391 or Mike Holder at 575-308-1115.

Sincerely,

A handwritten signature in blue ink, appearing to read "Case Hinkins".

Case Hinkins  
Environmental Manager  
HF Sinclair Navajo Refining LLC
