Re: Closure Request and Reclamation Plan
New Wave Old Indian Draw Frac Line
Incident Number NAPP2505952408
Eddy County, New Mexico

To Whom It May Concern:

Ensolum, LLC (Ensolum), on behalf of New Wave Energy Services Group (New Wave) and Mewbourne Oil Company (Mewbourne), has prepared this *Closure Request* to document excavation and soil sampling activities at the New Wave Old Indian Draw Frac Line (Site). The purpose of the excavation and soil sampling activities, conducted in accordance with an approved *Remediation Work Plan (Work Plan)*, was to address impacts to soil following a release of produced water. Based on field observations, field screening activities, and soil sample laboratory analytical results, Mewbourne is submitting this *Closure Request*, describing remedial activities that have occurred and requesting no further remediation for Incident Number NAPP2505952408.

SITE DESCRIPTION AND RELEASE SUMMARY

The Site is located in Unit B of Section 13, and Units B of Section 12, Township 22 South, Range 27 East, in Eddy County, New Mexico (source location: 32.39774°, -104.14157°) and is associated with oil and gas exploration and production operations on federal land managed by the Bureau of Land Management (BLM) and private land managed by Select Water Solutions (Select).

On February 17, 2025, a produced water surface pipeline failed, resulting in the release of 1,137 barrels (bbls) of produced water onto an active right-of-way (ROW) and into the surrounding pasture area. A vacuum truck was dispatched to the Site and recovered 120 bbls of the released fluids. Mewbourne reported the release to the New Mexico Oil Conservation Division (NMOCD) via Notification of Release (NOR) and Initial C-141 Application (C-141) on February 28, 2025. The release was assigned Incident Number NAPP2505952408.

Ensolum conducted assessment and delineation activities across an estimated 173,268 square-foot release area. Delineation soil sample laboratory analytical results indicated chloride impacts to soil existed up to a maximum depth of 6 feet below ground surface (bgs). The results were presented in a *Work Plan,* which was submitted on May 17, 2025, and approved with conditions by the NMOCD on June 2, 2025. The *Work Plan* is included in Appendix A and proposed excavation of impacted soil and confirmation soil sampling that included a 400 square-foot sampling frequency variance for all confirmation floor soil samples. The sampling variance frequency was denied. . The NMOCD conditions of approval are below.

"Remediation plan is approved as written except with the following conditions: 1. Mewbourne must complete the excavation and removal of impacted soils until confirmation samples collected from the

bottom and sidewalls of the excavation report NMOCD Closure Criteria per 19.15.29.12D NMAC has been achieved. 2. OCD denies the sampling frequency of 400 square feet (ft.2) per one (1) 5-point composite sample (5pcs) for the excavation floor samples. Must comply with 200 ft.2 per 19.15.29.12D (1c) NMAC for both excavation floor and sidewall confirmation samples. 3. Prior to backfilling the open excavation per 19.15.29.12D (2) NMAC, Mewbourne must collect a minimum of one (1) 5pcs from the media being used as backfill to verify that it meets non-waste containing, uncontaminated, earthen material with chloride concentrations less than 600 mg/kg as analyzed by EPA Method 300.0, or other test methods approved by the division."

SITE CHARACTERIZATION AND CLOSURE CRITERIA

As documented in the approved *Work Plan*, the following NMOCD Table I Closure Criteria (Closure Criteria) apply:

- Benzene: 10 milligrams per kilogram (mg/kg)
- Benzene, toluene, ethylbenzene, and total xylenes (BTEX): 50 mg/kg
- Total petroleum hydrocarbons (TPH): 100 mg/kg
- Chloride: 600 mg/kg

EXCAVATION AND SOIL SAMPLING ACTIVITIES

Between May 7 and August 6, 2025, Ensolum personnel were at the Site to oversee excavation activities and conduct confirmation soil sampling in accordance with the approved *Work Plan*. Excavation activities were performed using heavy equipment, hydro-vacuum trucks, and transport vehicles. To direct excavation activities, Ensolum personnel field screened the soil for volatile organic compounds (VOCs) utilizing a calibrated photoionization detector (PID) and chloride using Hach® chloride QuanTab® test strips. Following the removal of impacted soil, 5-point composite soil samples representing no more than 200 square feet from the sidewalls and floor of the excavation. The 5-point composite soil samples were collected by placing five equivalent aliquots of soil into a 1-gallon, resealable plastic bag and homogenizing the samples by thoroughly mixing.

Confirmation soil samples FS01 through FS668 were collected from the floor of the excavation at depths ranging from 1-foot to 8.5 feet bgs. Confirmation soil samples SW01 through SW71 were collected from the sidewalls of the excavation at depths ranging from ground surface to 8.5 feet bgs. Confirmation soil samples CS01 through CS193 were collected at the surface and from within the release area where excavation activities did not occur. Gaps in the numerical order of the confirmation soil samples (CS01 through CS193) are present due to excavation of failing samples. All excavated confirmation samples, with the exception of CS26 and CS34, which were excavated and resampled with the original nomenclature, and their corresponding confirmation floor samples and are presented on Table 1. The excavation extent and confirmation soil sample locations were mapped utilizing a Global Positioning System (GPS) unit and are depicted on Figures 1A through 1H. Photographic documentation of the excavation activities are provided in Appendix B.

The confirmation soil samples were placed directly into pre-cleaned glass jars, labeled with the location, date, time, sampler name, method of analysis, and immediately placed on ice. The soil samples were transported under strict chain-of-custody procedures to Cardinal Laboratories (Cardinal) in Hobbs, New Mexico, for analysis of the following contaminants of concern (COCs): BTEX following United States Environmental Protection Agency (EPA) Method 8021B; TPH-gasoline range organics (GRO), TPH-

diesel range organics (DRO), and TPH-oil range organics (ORO) following EPA Method 8015M/D; and chloride following Standard Method SM4500.

The final excavation extent measured approximately 173,379 square feet. A total of approximately 16,696 cubic yards of impacted soil was removed during the excavation activities. The impacted soil is in the process of being properly disposed of at the R360 Halfway Disposal in Hobbs, New Mexico. Copies of all disposal manifests will be made available upon request. The final excavation extent is in the process of being backfilled with material purchased locally and recontoured to match pre-existing Site conditions. Four representative 5-point composite samples (BF01 through BF04) were collected from the topsoil backfill material on July 18, 2025. The backfill soil samples were handled and submitted for the same COCs as described above, with the exception of chloride, which was analyzed following EPA 300.0 method, and submitted to Eurofins Laboratories (Eurofins) in Carlsbad, New Mexico.

LABORATORY ANALYTICAL RESULTS

Laboratory analytical results for all final excavation confirmation floor and sidewall soil samples, composite soil samples, and backfill soil samples indicated all COC concentrations were compliant with the Closure Criteria and reclamation standards. The laboratory analytical results are summarized on the attached Table 1 and the complete laboratory analytical reports are included in Appendix C.

RECLAMATION PLAN

Once the backfilling of the excavation is complete, the area will be recontoured to match pre-existing Site conditions. The soil in the vicinity of the release area includes predominately loamy fine sand (Tonuco loamy fine sand, 0 to 3 percent slopes, eroded). The Site will be seeded with BLM seed mix #2 for sandy sites at the rate specified in pounds of pure live seed (PLS) per acre.

Species/Cultivar	**PLS/Acre**
Sand dropseed (*Sporobolus cryptandrus*)	1.0
Sand love grass (*Eragrostis trichodes*)	1.0
Plains bristlegrass (*Setaria macrostachya*)	2.0

The seed mix will be applied via drill seeding or broadcast seeding. If broadcast seeding is selected, the PLS/acre will be doubled, and the seed will be raked in by chaining or dragging the Site.

VEGETATION MONITORING

The Site will be monitored for vegetation growth to verify reclamation activities were successful. Focus for this phase will be to prevent erosion and Site degradation, and to monitor for and treat invasive and noxious weed species.

- Annual inspections will take place at the location to monitor revegetation progress.
- If necessary, an additional application of the BLM seed mix will be applied.
- Noxious and invasive weeds will be identified and treated by licensed contracted herbicide applicators or mechanically/physically removed.

Reclamation activities will be documented via on-site monitoring and photographs will be included in a *Re-Vegetation Report* once vegetation growth in the reclaimed pasture area has a uniform vegetative cover that reflects a life-form ratio of plus or minus 50 percent (%) of pre-disturbance levels and a total percent plant cover of at least 70% of pre-disturbance levels, excluding noxious weeds, per NMAC 19.15.29.13 D.(3).

CLOSURE REQUEST

Excavation activities were conducted at the Site as indicated in the *Work Plan* to address the February 17, 2025, release of produced water. A copy of the approved *Work Plan* is presented in Appendix A. Laboratory analytical results for all confirmation soil samples collected from the final excavation and release extent indicated COC concentrations were compliant with the Closure Criteria and reclamation requirements. Based on the soil sample laboratory analytical results, no further remediation is required. The excavation will be backfilled with material purchased locally and the Site will be recontoured to match pre-existing Site conditions.

Excavation of soil has mitigated impacts to soil that exceeded Closure Criteria and reclamation requirements at the Site. Mewbourne believes these remedial actions are protective of human health, the environment, and groundwater. As such, Mewbourne respectfully requests no further remediation for Incident Number NAPP2505952408.

Re: Remediation Work Plan
New Wave Old Indian Draw Frac Line
Incident Number NAPP2505952408
Eddy County, New Mexico

To Whom It May Concern:

Ensolum, LLC (Ensolum), on behalf of New Wave Energy (New Wave) and Mewbourne Oil Company (Mewbourne), has prepared the following *Remediation Work Plan* (*Work Plan*) to document delineation activities completed to date and propose excavation of impacted soil identified at the New Wave Old Indian Draw Frac Line (Site). The purpose of the delineation activities was to define the lateral and vertical extent of impacted soil resulting from a produced water release. The following *Work Plan* proposes to excavate impacted soil and conduct confirmation soil sampling activities.

SITE DESCRIPTION AND RELEASE SUMMARY

The Site is located in Unit B of Section 13, and Units N and O of Section 12, Township 22 South, Range 27 East, in Eddy County, New Mexico (32.39774°, -104.14157°) and is associated with oil and gas exploration and production operations on federal land managed by the Bureau of Land Management (BLM) and private land managed by Select Water Solutions (Select).

On February 17, 2025, a produced water surface pipeline failed, resulting in the release of 1,137 barrels (bbls) of produced water onto an active right-of-way (ROW) and into the surrounding pasture area. A vacuum truck was dispatched to the Site and recovered 120 bbls of the released fluids. New Wave reported the release to the New Mexico Oil Conservation Division (NMOCD) via Notification of Release (NOR) and Initial C-141 Application (C-141) on February 28, 2025. The release was assigned Incident Number NAPP2505952408.

SITE CHARACTERIZATION AND CLOSURE CRITERIA

The Site was characterized to assess the applicability of Table 1, Closure Criteria for Soils Impacted by a Release, of Title 19, Chapter 15, Part 29 (19.15.29) of the New Mexico Administrative Code (NMAC). Results from the characterization desktop review are presented below and potential Site receptors are identified on Figure 1.

Depth to groundwater at the Site is estimated to be less than 50 feet below ground surface (bgs) based on the nearest groundwater well data. On December 9, 2021, New Mexico Office of State Engineer (OSE) permitted well (C-4554) was advanced to a depth of 80 feet below ground surface (bgs) approximately 0.34 miles west of the Site. The recorded depth to groundwater after the well completion was finished was 18 feet bgs. The Well Record & Log is included in Appendix A.

The closest continuously flowing or significant watercourse to the Site is a freshwater emergent wetland, located approximately 4,290 feet southeast of the Site. The Site is greater than 200 feet from a lakebed, sinkhole, or playa lake and greater than 300 feet from an occupied residence, school, hospital, institution, church, or wetland. The Site is greater than 1,000 feet to a freshwater well or spring and is not within a 100-year floodplain or overlying a subsurface mine. The Site is underlain by unstable geology (high potential karst designation area).

Based on the results of the Site Characterization, the following NMOCD Table 1 Closure Criteria (Closure Criteria) apply:

- Benzene: 10 milligrams per kilogram (mg/kg)
- Benzene, toluene, ethylbenzene, and total xylenes (BTEX): 50 mg/kg
- Total petrolum hydrocarbon (TPH): 100 mg/kg
- Chloride: 600 mg/kg

A reclamation requirement of 600 mg/kg chloride and 100 mg/kg TPH applies to the top 4 feet of the pasture area that was impacted by the release, per 19.15.29.13.D (1) NMAC for the top 4 feet of areas that will be reclaimed following remediation.

SITE ASSESSMENT AND DELINEATION ACTIVITIES

On April 9, 2025, Ensolum personnel conducted Site assessment and delineation activities to evaluate the release extent based on information provided on the C-141 and visual observations. Twenty-four delineation soil samples (SS01 through SS24) were collected within and around the release extent from a depth of 0.5 feet bgs to assess the lateral and vertical extent of the release. The soil samples were field screened for volatile organic compounds (VOCs) utilizing a calibrated photoionization detector (PID) and chloride using Hach® chloride QuanTab® test strips. The release extent and soil sample locations were mapped utilizing a handheld Global Positioning System (GPS) unit and are depicted on Figure 2. Photographic documentation was completed during the Site visit and a photographic log is included in Appendix B.

The delineation soil samples were placed directly into pre-cleaned glass jars, labeled with the location, date, time, sampler name, method of analysis, and immediately placed on ice. The soil samples were transported under strict chain-of-custody procedures to Cardinal Laboratories (Cardinal) in Hobbs, New Mexico, for analysis of the following contaminants of concern (COCs): BTEX following United States Environmental Protection Agency (EPA) Method 8021B; TPH-gasoline range organics (GRO), TPH-diesel range organics (DRO), and TPH-oil range organics (ORO) following EPA Method 8015M/D; and chloride following Standard Method SM4500.

Between April 11 and April 15, 2025, Ensolum personnel returned to the Site to oversee vertical delineation of the release. Thirteen boreholes (PH01, BH01 through BH12) were advanced via hand auger and heavy equipment to depths ranging from 1-foot to 6 feet bgs. Delineation boreholes PH01 was advanced in the area of SS18, BH01 was advanced in the area of SS24, BH02 in the area of SS23, BH03 in the area of SS22, BH04 in the area of SS21, and BH05 in the area of SS20. Discrete delineation soil samples were collected from each borehole at depths ranging from 1-foot bgs to 6 feet bgs. Soil from the boreholes was field screened for VOCs and chloride as described above. Field screening results and observations were logged on lithologic/soil sampling logs, which are included in Appendix C. Delineation soil samples collected from each borehole were handled and analyzed for the same COCs as described above and submitted to Cardinal. All boreholes and delineation soil sample locations are depicted on Figure 2.

LABORATORY ANALYTICAL RESULTS

Laboratory analytical results for the delineation soil samples SS01 through SS17 collected outside the release extent, indicated COC concentrations were in compliance with the Closure Criteria and reclamation requirements, successfully defining the lateral extent of the release. Delineation soil samples SS18, PH01A, SS23, SS24, BH06, BH09, BH09A, BH11, BH11A, BH11B, BH11D, BH11E, BH12, and BH12A indicated chloride concentrations exceeded reclamation requirement standards. All other delineation soil samples collected indicated COC concentrations below the Closure Criteria and reclamation requirement standards. This includes all soil samples collected from the terminal depths of all boreholes advanced, thus, successfully defining the vertical extent of the release. Laboratory analytical results are summarized in Table 1 and the Laboratory Analytical Reports & Chain-of-Custody Documentation are presented in Appendix D.

PROPOSED REMEDIATION WORK PLAN

The delineation soil sampling results indicate soil containing elevated concentrations exists across an approximate 173,268 square foot area and extends to a maximum depth of 6 feet bgs. New Wave proposes to complete the following remediation activities:

- Excavation of impacted soil to depths ranging from 1-foot to 6 feet bgs. An estimated 15,900 cubic yards impacted soil will be excavated. The excavated soil will be transferred a New Mexico approved landfill disposal facility for disposal.

- Based on an estimated 173,268 square-foot release extent area, New Wave requests a variance for frequency of excavation confirmation soil samples. New Wave proposes the frequency of confirmation soil sampling for the excavation floor to be every 400 square feet. This would decrease the total amount of soil samples from approximately 866 samples (every 200 square feet) to approximately 433 samples (every 400 square feet). Each 5-point confirmation composite floor soil sample will be collected by placing five equivalent aliquots of soil into a 1-gallon, resealable plastic bag and homogenizing the samples by thoroughly mixing. The proposed sampling grid and approximate excavation extent area is depicted on Figure 3b. All sidewall confirmation soil samples will be collected at a frequency of every 200 square feet (approximately 26 samples). The soil samples will be handled and analyzed for the same COCs described above and submitted to Cardinal.

- Following excavation and a review of confirmation soil sampling results indicating impacted soil has been removed, the excavation will be backfilled with locally procured like-material and recontoured to match pre-existing Site conditions and reseeded with a BLM approved seed mixture.

New Wave will proceed with the excavation and soil sampling activities and will submit a Closure Report within 90 days of the date of approval of this Work Plan by the NMOCD.
