SYNOPSIS

Etech Environmental & Safety Solutions, Inc. (Etech), on behalf of WPX Energy Permian, LLC (WPX), presents the following Site Characterization and Remediation Plan Addendum (SCRPA) detailing site assessment and delineation soil sampling activities associated with an inadvertent release of produced water at the Barbados State #001 SWD (Site). WPX proposes this SCRPA, which summarizes soils sampling activities, corrective actions, and details remediation objectives to rectify environmental impacts at the Site in accordance to re-evaluated Site Closure Criteria.

SITE LOCATION AND RELEASE BACKGROUND

The Site is located in Unit I, Section 32, Township 23 South, Range 26 East, in Eddy County, New Mexico (32.346210°, -104.308265°) and is associated with oil and gas exploration and production operations on State Land (**Figure 1** in **Appendix A)**.

On June 28, 2016, it was discovered that corrosion of a 2-inch valve on a pump discharge line resulted in approximately 65 barrels (bbls) of produced water to be released and on the well pad surface. Vacuum trucks were immediately dispatched and recovered approximately 60 bbls of free-standing fluids. The day following release discovery, WPX immediately noticed the New Mexico Oil Conservation Division (NMOCD) and the New Mexico State Land Office (NMSLO) via phone and email. WPX reported the release to the NMOCD on a Release Notification and Corrective Action Form C-141 (Form C-141), which was received by the NMOCD on July 12, 2016, and was assigned Incident Number nAB1619656595. The observed release extent, hereafter combined with the Area of Concern (AOC) is presented in **Figure 2** in **Appendix A**.

Due to the release impacting an area beyond the pad boundary on a third-party operator's active lease (LG82910006), a Right of Entry (ROE) Permit to access pasture soil surrounding the Site was required since WPX does not have any active wells on the lease. WPX contracted SWCA Environmental Consultants (SWCA) to conduct a cultural survey of the requested area, as required in the Cultural Properties Protection Rule, and submitted the ROE in preparation for soil characterization and/or remediation activities. The completed *NMSLO Cultural Resources Cover Sheet Exhibit A* form is included in **Appendix B**. The Site is located within a potential Scheer's Beehive Cactus habitat and a potential Wright's Water-Willow habitat, and as such, a biological survey was required. The biological survey was negative for both habitats, and the survey is included in **Appendix C**. Executed permit RE-6694 was issued on September 18, 2023, prior to accessing pasture soil for remediation purposes. In order to prepare for additional drilling activities detailed in this SCRPA, permit RE-6694 was reissued on June 3, 2024.

REPORTING ARCHIVE HISTORY

Prior to the continuation of drilling activities and reissuance of permit RE-6694, Etech prepared a Site Characterization and Remediation Plan (SCRP) report, which was submitted to the NMOCD for review on August 19, 2024. The SCRP detailed delineation activities that were completed through February 6, 2024, and proposed additional delineation activities with a scheduled start date and anticipated duration of completion, assigned application ID number (374824).The NMOCD denied the report on December 19, 2024, for the following reasons:

- *"Remediation plan rejected as it does not meet the requirements of 19.15.29.12C.(1) NMAC. Delineation of the site is incomplete. The estimated volume of impacted material to be remediated is incomplete and there is not a proposed timeline for remediation activities. Submit a complete and accurate report through the OCD permitting website by 1/24/2025."*

Following the rejection of application ID number (374824), additional delineation activities were completed. Etech prepared an SCRPA detailing a remediation summary of continued drilling activities with updated data to complete delineation at the Site. The SCRPA was submitted to the NMOCD and NMSLO

on December 19, 2024, and February 27, 2025, respectively. The SCRPA (application ID number 435346) was approved by the NMOCD and NMSLO with the following conditions on February 28, 2025, by the NMOCD and March 8, 2025 by the NMSLO:

- *The Remediation Plan is Conditionally Approved. This release is in a critical karst area and will need to be remediated to the strictest closure criteria of <50' depth to groundwater from Table 1 of the OCD Spill Rule. Samples must be analyzed for all constituents listed in Table I of 19.15.29.12 NMAC. Confirmation samples should be collected every 200 ft2. Sidewall samples should be delineated/excavated to 600 mg/kg for chlorides and 100 mg/kg for TPH to define the edge of the release. All off-pad areas must meet OCD reclamation/revegetation standards. The variance to excavate the AOC up to 5 feet bgs and install liner is denied. The 400 ft2 confirmation sample size is denied, due to the sensitive nature of the site location. Due to the depth of potential excavation, please make sure extreme safety precautions are taken to ensure personnel safety. The work will need to occur in 90 days after the work plan has been approved.*

WPX requested the extension from the NMOCD of the current deadline of March 29, 2025, which was granted a 90-day extension to August 28, 2025, to confirm, or further determine, whether karst features identified in the initial Karst Study Report via geotechnical drilling required mitigation prior to advancing an excavation.

SITE CHARACTERIZATION AND CLOSURE CRITERIA

Etech characterized the Site according to Table I, Closure Criteria for Soils Impacted by a Release, of Title 19, Chapter 15, Part 29, Section 12 (19.15.29.12) of the New Mexico Administrative Code (NMAC) considering depth to groundwater and the proximity to:

- Any continuously flowing watercourse or any other significant watercourse;
- Any lakebed, sinkhole or playa lake (measured from the ordinary high-water mark);
- An occupied permanent residence, school, hospital, institution or church;
- A spring or a private, domestic fresh water well used by less than five households for domestic or stock watering purposes;
- Any freshwater well or spring;
- Incorporated municipal boundaries or a defined municipal fresh water well field covered under a municipal ordinance;
- A wetland;
- A subsurface mine;
- An unstable area (i.e. high karst potential); and
- A 100-year floodplain.

Depth to groundwater at the Site is estimated to be between 51 feet and 100 feet below ground surface (bgs) based on a recent depth to groundwater measurement of United States Geological Survey (USGS) well 322117104183501, located approximately 0.5-mile northwest of the Site. The well was advanced to a total of 140 feet bgs with a current depth to groundwater from on January 30, 2018, documented at 94.9 feet bgs. An additional well located approximately 0.5-mile northeast of the Site indicates depth to groundwater is greater than 100 ft bgs, however, the measurement was taken over 25 years ago. Referenced well records are provided as **Appendix D**. The well locations and additional regional groundwater well locations are shown in **Figure 1A** in **Appendix A**.

Based on the desktop review, the current BLM Carlsbad Field Office (CFO) karst cave potential map indicates the Site overlies a designated critical karst potential zone. As such, WPX retained BLM approved karst contractor, Dave Decker, PhD, with Southwest Geophysical Consulting, LLC (Southwest Geophysical) to conduct an aerial karst survey at the Site prior to initiating any ground disturbance. In conjunction with Google Earth Pro (2019) satellite aerial imagery and imagery of the Site collected on August 23, 2023, Southwest Geophysical identified one surface karst feature of "high-likelihood" and three surface karst features of "medium-likelihood" within the survey area. Since planned remediation

activities were not anticipated to be near these locations, it was not required for the identified surface karst features to be field verified or that a karst monitor was required to be present during scheduled remediation activities.

On March 6, 2025, Southwest Geophysical conducted a geophysical Electrical Resistivity Imaging (ERI) karst survey to determine the Site stability. The karst survey yielded positive for two anomalies consistent with air-filled void(s), but the Site subsurface was interpreted to have well-layered stratigraphy which prompted further evaluation of subsurface conditions. In order to assess the anomalies referenced in the Karst Study Report, two borings (BH44 and BH45) were advanced to verify the interpretations suggested by Southwest Geophysical.

From July 17, 2025, through July 24, a truck mounted drill rig equipped with air rotary and/or hollow stem auger drilled at the anomaly locations denoted in the ERI karst survey under supervision of an approved karst monitor employed by Southwest Geophysical. Following the advancement of each boring, the karst monitor inspected the borehole via borehole camera to directly observe the subsurface conditions. Drilling activities and camera imagery confirmed that the two anomalies initially interpreted to be either subsurface voids or conduits were instead a high-resistivity gravel lens overlain by low-resistivity clay. No evidence of voids, conduits, or significant karst features were observed; the supplemental drilling confirmed no surface karst features existed within 200 feet of the Site, no shallow anomalies such as large voids or related karst features are located within the survey area, and a well-layered stratigraphy is being interpreted to exist in the subsurface where the geophysical survey was performed, indicating that the surface ground is stable. The complete summary of the Environmental Karst Study is included in **Appendix E**.

The AOC is not located within a designated flood-zone based on available Federal Emergency Management Agency (FEMA) Flood Insurance Rate Maps (FIRMS) and current zoning designations. However, a small portion of the recent anomaly locations soil sampling results, indicates that the AOC has the potential to partially fall within a flood-zone under certain conditions. The flood-zone in question is shown as a “Zone A” with no Base Flood Elevation (BFE) determination which does not, confirm that the Site lies within a flood-zone, or a defined base flood elevation exists for the area; specifically, the Site is not designated as within “Zone AE” on a Special Flood Hazard Are (SFHA) within clearly defined BFE.

All other potential receptors are not within the established buffers in NMAC 19.15.29.12. Receptor details and sources used for the Site characterization are included in **Figure 1B** and **Figure 1C** in **Appendix A**.

Based on the results from the desktop review, the revised Environmental Karst Study, and the estimated depth to groundwater at the Site, the following Closure Criteria was applied:

Constituents of Concern (COCs)	Laboratory Analytical Method	Closure Criteria*
Chloride	Environmental Protection Agency (EPA) 300.0	10,000 milligram per kilogram (mg/kg)
Total Petroleum Hydrocarbon (TPH)	EPA 8015 M/D	2,500 mg/kg
TPH-Gasoline Range Organics (GRO) + TPH-Diesel Range Organics (DRO)	EPA 8015 M/D	1,000 mg/kg
Benzene	EPA 8021B or EPA 8260B	10 mg/kg
Benzene, Toluene, Ethylbenzene, Total Xylenes (BTEX)	EPA 8021B or EPA 8260B	50 mg/kg

Soil sample was collected in the top 4 feet of areas to be immediately reclaimed following remediation pursuant to NMAC 19.15.17.13, if exceeding the reclamation concentration requirements of 600 mg/kg chloride and 100 mg/kg TPH.

DELINEATION SOIL SAMPLING ACTIVITIES

On July 6, 2023, Etech conducted delineation soil sampling activities to confirm details of the release provided on the Form C-141 and to characterize the release by verifying the presence or absence of impacted soil compared to the applied Closure Criteria before karst studies were performed. Two delineation borings (BH01 and BH02) were advanced via mechanical equipment, which were driven by field screening soil for volatile organic compounds (VOCs) utilizing a calibrated photoionization detector (PID) and chloride using Hach® chloride QuanTab® test strips. Soil samples were collected from each delineation soil sampling location for laboratory analyses, representing at minimum the highest observed field screening concentrations and the greatest depth. Upon completion of BH02, Etech concluded that equipment limitations would inhibit achievement of further delineation. A drill rig was scheduled to return to continue delineation activities.

On January 24 through February 6, 2024, Etech returned to the Site equipped with a drill rig to continue delineation soil sampling activities. Twenty-six delineation boreholes (BH01 through BH26) were advanced to continue assessing the lateral and vertical extent of the release. Delineation activities were driven by field screening soil for VOCs and chloride as previously described. Soil samples were collected from each delineation soil sampling location up to 29 feet bgs for laboratory analyses, representing at minimum the highest observed field screening concentrations and the greatest depth. Field screening results and soil descriptions from all delineation activities are included on soil sampling logs shown in **Appendix F**. The locations of the delineation soil samples are shown in **Figure 2** and in **Appendix A**. Photographic documentation of delineation activities is included in **Appendix G**.

On September 9 through September 12, 2024, Etech returned to the Site equipped with a sonic drill rig to continue delineation soil sampling activities as proposed in the SCRP. The extent of residual impacts extends beyond the observed subject release area. As such, an Area of Concern (AOC) was created to encompass all identified residual impacts as per laboratory analytical results in respect to Site Closure Criteria (**Figure 3** in **Appendix A**). Eighteen delineation boreholes (BH02 and BH27 through BH43) were advanced to continue assessing the lateral and vertical extent of the release. Delineation activities were driven by field screening soil for VOCs and chloride as previously described. Soil samples were collected at a 5-foot interval maximum from each delineation soil sampling location up to 29 feet bgs for laboratory analyses, representing at minimum the highest observed field screening concentrations and the greatest depth. Field screening results and soil descriptions from all delineation activities are included on soil sampling logs shown in **Appendix F**. The locations of the delineation soil samples are shown in **Figure 2** and in **Appendix A**. Photographic documentation of delineation activities is included in **Appendix G**.

As previously mentioned, from July 17, 2025, through July 24, 2025, two additional borings (BH44 and BH45) were advanced for the purpose to investigate the presence and/or absence of subsurface karst features. Soil samples were collected at a 5-foot interval from each boring up to 60 feet bgs and field screened for VOCs and chloride as previously described. Field screening results and soil descriptions from all delineation activities are included on soil sampling logs shown in **Appendix F**. The locations of the delineation soil samples are shown in **Figure 2** in **Appendix A**. Photographic documentation of the karst investigation borings is included in **Appendix G**.

The delineation soil samples were placed directly into lab provided pre-cleaned jars, packed with minimal void space, labeled, and immediately placed on ice. The soil samples were transported under strict chain-of-custody procedures, to Envirotech, Inc. (Envirotech) in Farmington, New Mexico, for analysis of COCs.

LABORATORY ANALYTICAL RESULTS

Laboratory analytical results indicated that concentrations of Benzene and BTEX for all delineation soil samples were below the applicable Site Closure Criteria.

Laboratory analytical results indicated TPH concentrations for all delineation soil samples were below the applicable Site Closure Criteria, except soil samples collected from BH07 (0.5 feet bgs and 4 feet bgs) and BH13 (0.5 feet bgs) which are characterized by concentrations ranging from 145 mg/kg to 2,870 mg/kg.

Laboratory analytical results indicated chloride concentrations exceeded the applicable Site Closure Criteria up to 24 feet bgs throughout the AOC. Chloride concentrations for soil samples collected surrounding the AOC were below the Site Closure Criteria.

All terminus soil samples were below the applicable Site Closure Criteria. Laboratory analytical results are summarized in Table 1 in **Attachment H**, and the complete laboratory reports with chain-of-custody documentation is included in **Attachment I.**

PROPOSED REMEDIATION WORK PLAN

Based on the delineation soil sampling results, the following conclusions regarding the release are presented:

- Laboratory analytical results indicates that one or more of the COC concentrations exceeds the applicable Site Closure Criteria for all delineation borings located within the AOC above 4 feet bgs. Laboratory analytical results indicate that all COC concentrations are below the applicable Site Closure Criteria for all delineation borings located surrounding the AOC. As such, residual soil impacts have been sufficiently vertically and horizontally defined.
- The Site is in a high karst potential area designated by the BLM, however, an Environmental Karst Study (aerial and geophysical studies) with supplemental drilling, confirmed that no surface karst features existed within 200 feet of the Site, no shallow anomalies such as large voids or related karst features are located within the survey area. Therefore, a well-layered stratigraphy is being interpreted to exist in the subsurface where the geophysical survey was performed, indicating that the surface ground is stable.

A small portion of the recent anomaly borehole investigation data indicates that the AOC has the potential to partially fall within a flood-zone under certain conditions, with the flood-zone in question shown as Zone A with a BFE determination. However, no BFE designation Zone denotes uncertain flood data, while a Zone AE denotes a higher-risk, well defined SFHA. Based on the conclusions drawn above, WPX proposes the following remedial corrective actions:

- WPX proposes to excavate the AOC to depths consistent with delineation laboratory data where possible in an effort to remove as much residually impacted soil above the Site Closure Criteria and/or reclamation standard based on conditions that have been re-evaluated via Site investigation (likelihood of karst that results in an Unstable Area). “Unstable area” as defined by 19.15.2 NMAC through 19.15.39 NMAC and more recently via the NMOCD *Karst Public Notice* is a “location that is susceptible to natural or human-induced events or forces capable of impairing the integrity of some or all a division-approved facility’s structural components. Examples of unstable areas are areas of poor foundation conditions, areas susceptible to mass earth movements and karst terrain areas where karst topography is developed because of dissolution of limestone, dolomite or other soluble rock. Characteristic physiographic features of karst terrain include sinkholes, sinking streams, caves, large springs and blind valleys.” The Site is stable based on recent drilling activities and no karst subsurface features such as voids were encountered. As requested by the NMOCD when pursuing a deviation from the most stringent closure criteria in a critical/high/medium karst potential occurrence zones, “If a site is in one of

these mapped occurrence zones it will be the responsibility of the operator/responsible party to provide verification that the site is not "unstable" […] and will required additional surveys. […] As part of the NMOCD approval process the operator will need to provide to the OCD a demonstration a review of the area and also received approval from any applicable Federal or State land management agency, such as BLM or SLO. If the appliable surface management agency does not approve of the operator's request, it will be denied by the OCD and will need to meet the most stringent closure criteria." Therefore, Devon retained BLM approved karst expert, Dave Decker with Southwest Geophysical to perform a Small Unmanned Aerial Systems (sUAS) surface karst survey, ERI survey and additional borehole investigation. The reports will be forwarded to the NMSLO for review.

- Due to the size of the anticipated excavation area approximately (52,806 square feet), WPX requests a variance for excavation confirmation soil samples to represent a maximum of 400 square feet per soil sample. As such, 133 samples are anticipated to be collected from the excavation floors compared to 265 floors following the standard 200 square foot soil sampling frequency. The 5-point excavation confirmation soil samples will be comprised of five equivalent aliquots homogenized in a 1-gallon, resealable plastic bag. The samples will be placed into lab provided pre-cleaned glass jars, packaged with minimal void space, labeled, and immediately placed on ice. The soil samples will be transported under strict chain-of-custody procedures to an accredited laboratory and analyzed for BTEX, TPH, and chloride.
- The proposed excavation may require third-party operator oversight and additional safety measures near their respective subsurface pipelines before or during excavation activities. WPX and/or the third-party operator may implement additional safety precautions above encroachment guidelines at their company's discretion for the health and safety of on-site personnel and for the structural integrity of utilities. Such restrictions include but are not limited to:
    i. Shifting the proposed excavation extent(s) to adhere to established buffer zone(s) around one or more utilities.
    ii. Inducing a change in proposed excavation(s) depth(s) around one or more utilities.
    iii. If applicable, all communication with third-party operator excavation requirements will be documented and presented to the NMOCD and NMSLO.
- Upon receipt and review of excavation confirmation soil sample laboratory analytical results, WPX will determine the appropriate measure of corrective actions that will include:
    i. Preparing land access permits, submit ROE to NMSLO for review, and scheduling any required biological surveys prior to advancing an excavation upon the ROE approval; and
    ii. Documenting the removal of impacted soil and restoration at the Site with a subsequent Closure and Reclamation Report detailing assessment, sampling activities, and Site restoration activities including, but not limited to backfilling the excavation with clean, locally sourced soil and restored to "as close to its original state as possible."

PROPOSED TIMELINE

Plugging and abandonment (P&A) activities of the Salt Water Disposal (SWD) at the Site were completed on December 4, 2024. Species: Scheer's Beehive Cactus, Wright's Waterwillow

Ms. Byers,

On behalf of Devon Energy Production Company (Devon), New Tech Global Environmental, LLC (NTGE) has prepared this letter to document survey activities for Scheer's Beehive Cactus (*Coryphantha robustispina* var. *scheeri)* and Wright's Waterwillow (*Justicia wrightii)* at the Barbados State #001 SWD (Site) for submittal to New Mexico State Land Office (NMSLO). The Site is located in Unit Letter I, Section 32, of Township 22 South and Range 26 East in Eddy County, New Mexico. The site location with respect to the nearest town is shown on Figure 1 and the topography of the area is shown on Figure 2.

On February 11, 2025, NTGE performed a site visit to a reference population of Wright's Waterwillow to confirm that it was conspicuous and detectable, due to the survey needing to take place three (3) weeks prior to the survey season outlined by the Bureau of Land Management (BLM). NTGE personnel confirmed with the NMSLO biologist before conducting survey activities.

Survey

Field survey efforts (presence/absence survey) for Scheer's Beehive Cactus and Wright's Waterwillow took place on February 13, 2025, by CFO Special Status Plant Species (SSPS) certified NTGE botanist Jillian Smiley and NTGE scientist Clayton Tumas. The SSPS survey was triggered by pending remedial action activities at the Site. The proposed area of disturbance is 5,770 square meters. A 200 meter required buffer area for major industrial/commercial developed sites (mineral pits, ponds, flare, CTB, and wellpads) was placed around the proposed area of disturbance. The total area surveyed consisted of 198,539 square meters. Approximately 24,364 square meters within the boundary were excluded due to fences, roadways, and a well pad. Transects were spaced 20 meters apart as per protocol for SSPS potential/suitable habitat. The BLM provided data schema was used to confirm that there were no known occurrences within the survey area. SSPS Potential habitat can be seen on Figure 3, Survey extent and planned transect lines can be seen on Figure 4. Actualized survey tracks can be seen on Figure 5. Habitat images are attached at the end of the report.

Survey Results

The survey resulted in a negative presence (absence) of Scheer's Beehive Cactus and Wright's Waterwillow. No similar species (i.e., *Coryphantha robustispina ssp, Justicia ssp.*.) were located within the survey area as well. Disturbance factors such as industrial development, roadways, electrical lines, and cattle grazing were evident throughout the survey space. There is 1 ecological site found within the area identified as Reagan-Upton association, 0 to 9 percent slopes. According to a database provided by USDA NRCS and NMSU, and Site can be classified as a state 3 shrub community according to a state and transition model. Much of the Site was dominated by *Prosopis glandulosa* (Honey Mesquite) and *Larrea tridentata* (Creosote). Ecological site information can be seen on Figure 6.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:20,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Eddy Area, New Mexico
Survey Area Data: Version 20, Sep 3, 2024

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Nov 12, 2022—Dec 2, 2022

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

1.0 INTRODUCTION

This report was commissioned by eTech Environmental & Safety Solutions, Inc. (hereinafter referred to as "the client"), on March 6, 2025, for the purpose of conducting an environmental karst study within an area encompassing the Barbados State No. 001 SWD site (hereinafter termed “BS01”) centered at N 32.346833° W 104.309131°.

1.1 Goals of this Study

The goals of this study are to conduct a surface karst inventory and provide the client with the location and description of any surface karst features located within 200 feet (61 meters) of the spill delineation boundary (as defined by 19.15.29.12 NMAC[1]) and to determine whether stable ground exists (as defined by 19.15.2 NMAC Definitions[2]) within the spill boundary of the Barbados State 001 release using electrical resistivity imaging[3].

1.2 Summary of Findings

- **No surface karst features exist within the 200-foot (61-meter) zone surrounding the spill delineation boundary.**
- **Two anomalies consistent with air-filled voids are located within the BS01 resistivity survey area, indicating the zone beneath the geophysical survey may be subject to collapse. These features were investigated and found to be stratigraphically, rather than karst related.**
- **Well-layered stratigraphy is interpreted to exist beneath the area where the geophysical survey was conducted.**

1.3 Affected Environment

The BS01 project site is located in evaporite karst terrain, a landform that is characterized by underground drainage through solutionally enlarged conduits. Evaporite karst terrain may contain sinkholes, sinking streams, caves, and springs. Sinkholes leading to underground drainages and voids are common. These karst features, as well as occasional fissures and discontinuities in the bedrock, provide the primary sources for rapid recharge of the groundwater aquifers of the region. Additionally, karst may develop by hypogene processes involving dissolution by upwelling fluids from depth independent of recharge from the overlying or immediately adjacent surface. Hypogene karst systems may not be connected to the surface and can remain undiscovered unless encountered during drilling or excavation.

Karst features are delicate resources that are often of geological, hydrological, biological, and archeological importance, and should be protected. The four primary concerns in these types of terrain are environmental issues, worker safety, equipment damage, and infrastructure integrity.

The Bureau of Land Management (BLM) categorizes all areas within the Carlsbad Field Office (CFO) zone of responsibility as having either low, medium, high, or critical cave potential based on geology, occurrence of known caves, density of karst features, and potential impacts to freshwater aquifers[4]. These designations are also recognized by the New Mexico State Land Office (NMSLO). This project occurs within a **CRITICAL** karst occurrence zone (CKOZ)[5] (**Figure 1**).

A critical karst occurrence zone is defined as an area in known soluble rock types with high density of significant cave systems and/or bedrock fractures that lead to the rapid recharge of karst groundwater aquifers from surface runoff. These areas provide critical drinking water supplies for major communities and ranching operations, and supply springs that support rivers and vital riparian habitats[4].

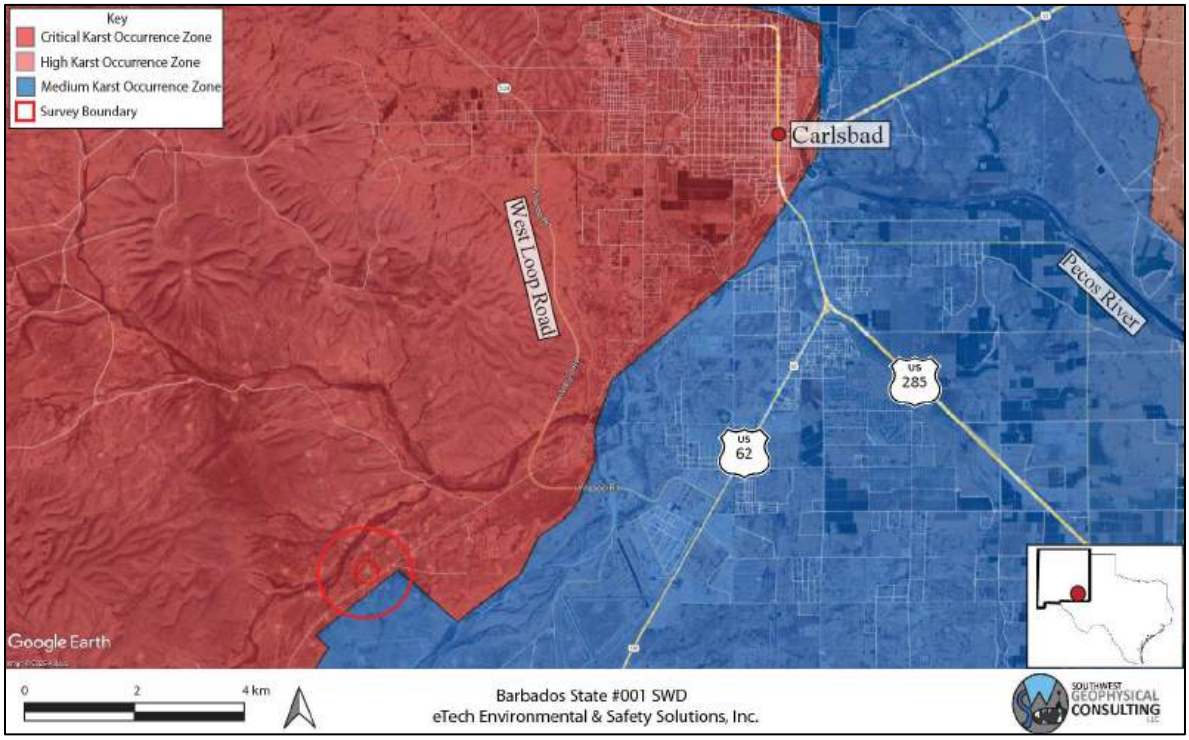

Figure 1: Karst occurrence zone overview. Background image credit: Google Earth. Image date: March 7, 2023. Image datum: WGS-84.

Due to the rapidity with which evaporite karst develops, each location within a BLM-CFO designated karst occurrence zone must be assessed on an individual basis to determine the existence of surface karst features and the possibility of sub-surface karst development each time a release occurs.

2.0 LOCATION AND DESCRIPTION OF STUDY AREA

2.1 Description of Site

The site is located 10.9 kilometers (6.8 miles) southwest of Carlsbad, New Mexico, north of Hidalgo Rural Road and southwest of West Loop Road. The release area is located within section 32 of NM T22S R26E[6] (**Figure 1** and **Figure 2**). The region has rolling terrain with karstification occurring in the gypsite soils and underlying gypsum and dolomite bedrock[7] (see section ***2.2 Local Geology Summary*** for further information). The climate in this area of southeast New Mexico is semi-arid with an average annual precipitation of approximately 13 inches, of which about two-thirds falls as rain during summer thunderstorms from June to October. Summers are hot and sunny while winters are generally mild, with an average maximum temperature of 96°F in July and an average minimum temperature of 28°F in January[8]. This area is within the Chihuahuan Desert Thornscrub as defined by the Southwestern Regional ReGAP Vegetation map[9] and the vegetation consists mostly of areas of blue grama, nine-awned pappus grass, burro grass and low scrub including yucca. The spill delineation boundary is located within a CKOZ[5] (**Figure 1**) and NMSLO managed land[10] (**Figure 2**).

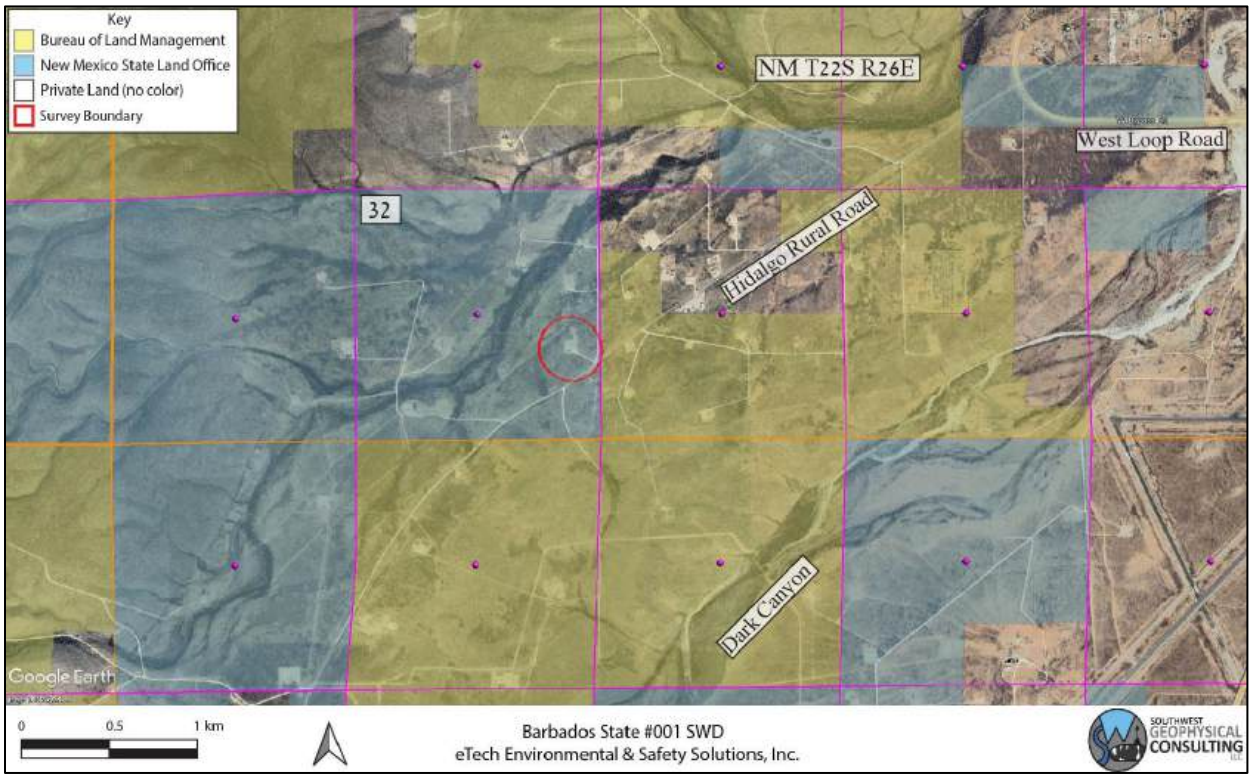

Figure 2: Land ownership and PLSS overview. Background image credit: Google Earth. Image date: March 7, 2023. Image datum: WGS-84.

2.2 Local Geology Summary

The site for the BS01 survey is located at an elevation of 1,015 meters (3,331 feet), ± 3 meters (9.8 feet). This region is underlain by the undivided Permian Tansill and Yates Formation (Pty). The area is mantled by thin calcareous soils (caliche) and piedmont gravels (Qp)[11] up to 5 meters in depth (**Figure 3**).

The Tansill Formation is mostly carbonate with minor siltstone and anhydrite. East of Highway 285 and along the Pecos River, the Tansill is predominantly dolomite. In places where the dolomitic beds are exposed, the contact with the overlying Salado gypsum and siltstone can also be seen. Both of the dolomitic and gypsiferous facies in the Tansill are prone to karst development[12].

The Yates Formation is dominated by a quartz-rich, frosted-sandstone facies with minor carbonate, anhydrite, and siltstone. Northwest of Carlsbad, there is a near-reef facies with inter-tongued carbonates and evaporites. The lower section of the Yates transitions with the upper portion of the Seven Rivers Formation. This area consists of dolomite interbedded with siltstone, fine-grained sandstone, and minor gypsiferous siltstone beds that are prone to karst development[12].

The survey area is covered by the easily accessible Geologic Map of New Mexico (2003) at 1:500,000 scale[13] and the Digital Geologic Map of New Mexico in ARC/INFO Format[11].

2.3 Description of Survey

2.3.1 Surface Karst Survey

Southwest Geophysical Consulting, in partnership with SWCA Environmental Consultants, provides surface karst surveys using small, uncrewed aerial systems (sUAS) that are flown by qualified, FAA licensed drone pilots and that meet the stringent Bureau of Land Management – Carlsbad Field Office requirements for both pedestrian and aerial karst surveys.

The surface karst survey includes a desk study prior to the flight which allows us to provide client feedback in the event of any previously known karst features in the area. The desk study is performed out to 305 meters (1,000 feet) from the spill delineation boundary per New Mexico Oil Conservation Division guidance[1] (**Figure 4**). The study was performed using satellite and aerial imagery from Google Earth Pro dated March 7, 2023 (please note features less than one meter in diameter are generally not visible using this method); the Southwest Geophysical Cave and Karst Database dated March 20, 2025[14]; the Kitchen Cove, NM, 1:24,000 quad, 1985, USGS topographic map; and the latest lidar imagery from CalTopo.com. Please note that we use older topographic maps because newer maps have had caves removed from them. These searches and queries returned no previously recorded karst features within the 305-meter survey boundary.

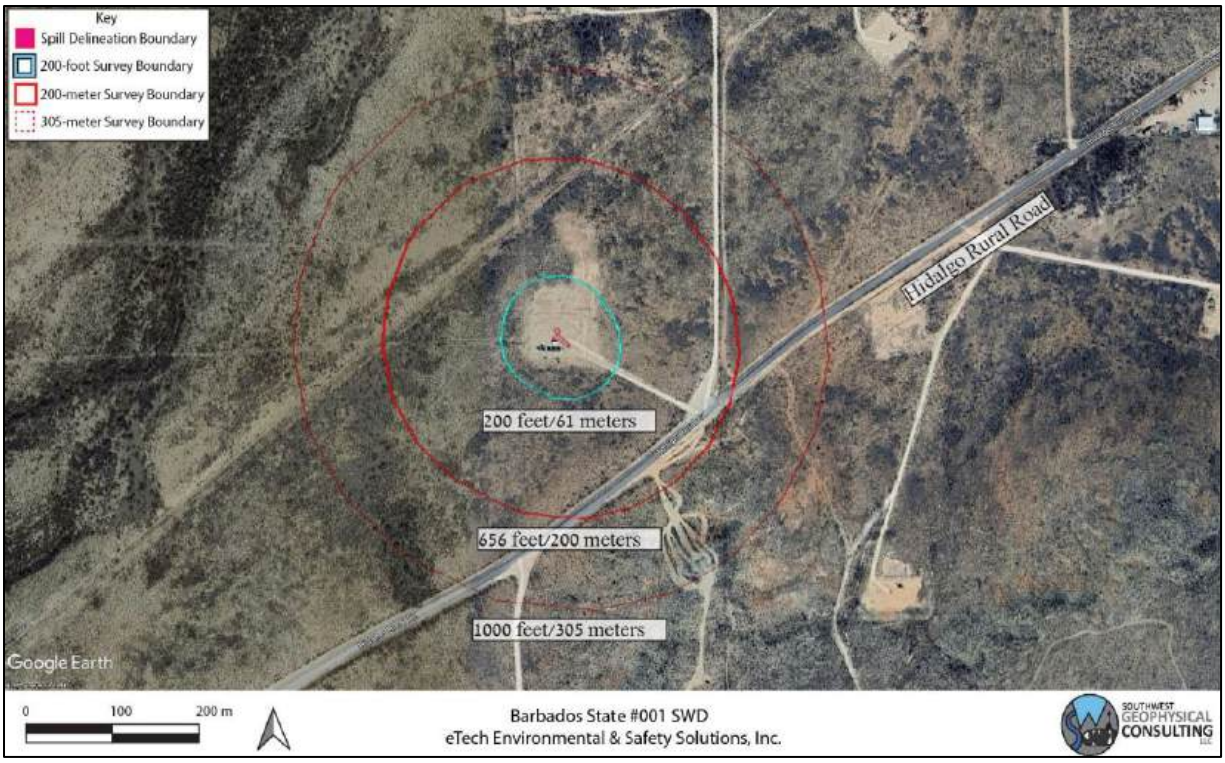

Figure 4: Surface survey overview. Background image credit: Google Earth. Image date: March 7, 2023. Datum: WGS-84.

Surface karst surveys are conducted by sUAS at low elevation within 200 meters of the spill delineation boundary[4] (**Figure 4**) following a preplanned raster pattern flightpath designed for the purpose of generating at least 75% imagery overlap. The collected high-resolution, georeferenced imagery is stitched together to develop orthomosaic imagery which is further developed into a digital elevation model (DEM); the DEM is then processed into a local relief model (LRM) (**Figure 6**). This LRM is color coded to enhance differences in elevation of as little as five centimeters. The orthoimagery, DEM, and LRM are uploaded to a server where they are analyzed by an experienced karst geologist. Finally, the data is reviewed by a senior karst geologist for quality assurance and downloaded into a table for inclusion in a written report[15].

The resolution of the orthoimagery is clear enough that features as small as 10 centimeters can be positively identified in most circumstances. Occasionally there are ambiguous features identified during an aerial survey that will need to be checked in the field if they are impacted by the proposed remediation efforts. Specifically, it is difficult to tell the difference between solution tubes, abandoned uncased well bores, and some burrows in drone imagery. If an ambiguous feature is located during imagery analysis, it is marked with a yellow dot in **Figure 6**. If a feature of any likelihood is subsequently verified in the field prior to publication of the report, the dot will be changed to a red triangle if confirmed as a karst feature or deleted if not.

The imagery for this study was collected via aerial survey by Pat Lagodney of SWCA on August 23, 2023. Surface karst features may have developed after this date and will not be noted in this report. Imagery analysis was completed by Garrett Jorgensen Olague of Southwest Geophysical Consulting on September 6, 2023. **NOTE:** a surface karst survey was commissioned by the client on July 19, 2023. These surface karst survey results were originally reported in report number ETEC-002-20230719.

2.3.2 Geophysical Survey

For this survey, an Advanced Geosciences Inc. (AGI) SuperSting™ Wifi R8 with a multi-electrode switchbox, a 28-electrode array of 40-centimeter-long electrodes, and a tablet controller were used to image the subsurface. This survey consisted of two resistivity lines in a dipole-dipole strong-gradient configuration; line one is laid out southeast to northwest while line two is laid out southwest to northeast. Both lines consisted of 28 electrodes at 5-meter spacing, resulting in 135-meter-long arrays (**Figure 5**, **Table 1**). A preconfigured command file was used to run the data collection (DDSG28). This electrode configuration provided a depth of investigation of 27 meters (89 feet) and a resolution of 2.5 to 3.0 meters (8.2 to 9.8 feet) within the first 5 to 8 meters (16 to 26 feet) from the surface. A Leica GS18 GPS was used to record electrode locations and elevations.

Table 1 provides basic line data. Detailed information including electrode number, location in latitude/longitude (decimal degree format), and elevation in meters can be found in the accompanying data files.

Table 1: Survey Line Data Table. The .kmz file contains all the points for the survey line listed in the file name. These data are available in the accompanying files BS01 _ERI_Points.xlsx and ETEC-012-20250306_BS01_Data_Files.kmz.

EarthImager™ 2D software was used to download and process the data and to provide the model used to make our interpretations. The design of the survey and the orientation of each of the lines provides the information necessary to make the determination of "stable" or "unstable" ground at this site.

A typical starting model was used for the data processing due to the two-layer model of the geology in the area; specifically, generally high-resistivity gypsum and dolomite at the surface and low-resistivity saturated gypsum and dolomite bedrock at depth. The starting model used was "average apparent resistivity" and a default inversion setting of "surface," with a minimum apparent resistivity set to 0.1 Ohm-meters (Ohm-m or Ω-m) and a max apparent resistivity set to 100,000 Ω-m (**Table 2**).

3.0 RESULTS

3.1 Surface Karst Survey

The desk study and surface karst survey showed no surface karst features within the 200-foot (61-meter)[1] survey area surrounding the spill delineation boundary (**Figure 6**).

One recognized surface karst feature is located within the 305-meter survey boundary, but outside of the 200-*meter* surface karst survey boundary (**Figure 6**, **Table 3**). Recognized surface karst features are features that are positively identified in either satellite or aerial imagery as karst features and the features have been visited by a qualified karst professional in the field and fully identified. Images for this feature are available on request.

No springs exist within the 305-meter survey boundary (**Figure 6**).

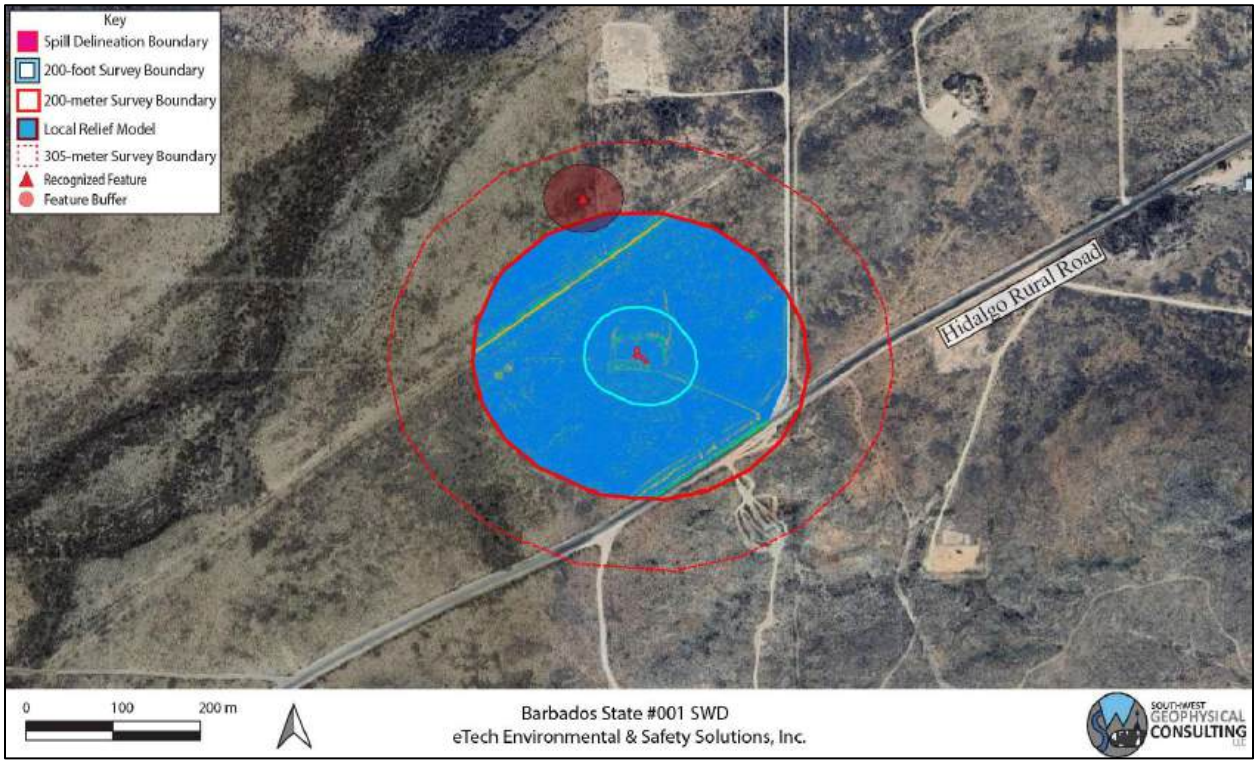

Figure 6: Surface karst survey results. Background image credit: Google Earth. Image date: March 20, 2023. Image datum: WGS-84.

Caution should be exercised while operating in or around all karst-related features due to the possibility of near-surface voids. Employing a BLM-CFO approved karst monitor on site during these activities is recommended.

Table 3 contains a list of features identified during the aerial karst survey and subsequent imagery analysis. Each feature is identified with a feature identification number (Feature ID), the type of feature, estimated size (in meters), recommended buffer (in meters), the likelihood of this feature being a surface karst feature (modifiers H/M for high or medium likelihood, V for field verified), and its location in WGS-84/UTM-13 (EPSG: 32613).

3.2 Geophysical Survey

Electrical resistivity tomography forms images of the subsurface by causing a current to flow through the rock and soil and then measuring the resistance of these materials as the current flows through them. This measurement is taken many times and the resulting data, once processed, is used to produce a model of the subsurface (**Figure 7**). This model is produced using "non-unique" solutions, which means that there are many models and interpretations which will satisfy the data. Using experience and knowledge of the local geology, a high-confidence model can be established and used to develop an accurate understanding of what lies below the surface. This survey was conducted with the express purpose of locating subsurface voids and does not purport to find paleokarst (old, non-active karst features that have been filled in with sand and sediment) or nascent karst features below the resolution limit of the survey.

The results of this study indicate a well-layered geologic system with resistivities between 5 and 1,100 Ohm-m (**Figure 7**). Two high-resistivity anomalies are present, one on each line. These anomalies have resistivities of 5,938 and 5,586 Ohm-m, respectively. Please keep in mind when viewing the 2D inverted resistivity sections that color maps can be widely different for each view. Always check the color map located on the right side of the image when viewing the 2D images to ensure you understand the range of resistivities presented. Distances along the top and depths along the left side are in meters. The color map along the right side is in Ohm-m. Due to the nature of the survey, shallower zones have higher resolution between electrodes than deeper zones; therefore, small features at depth will not be visible.

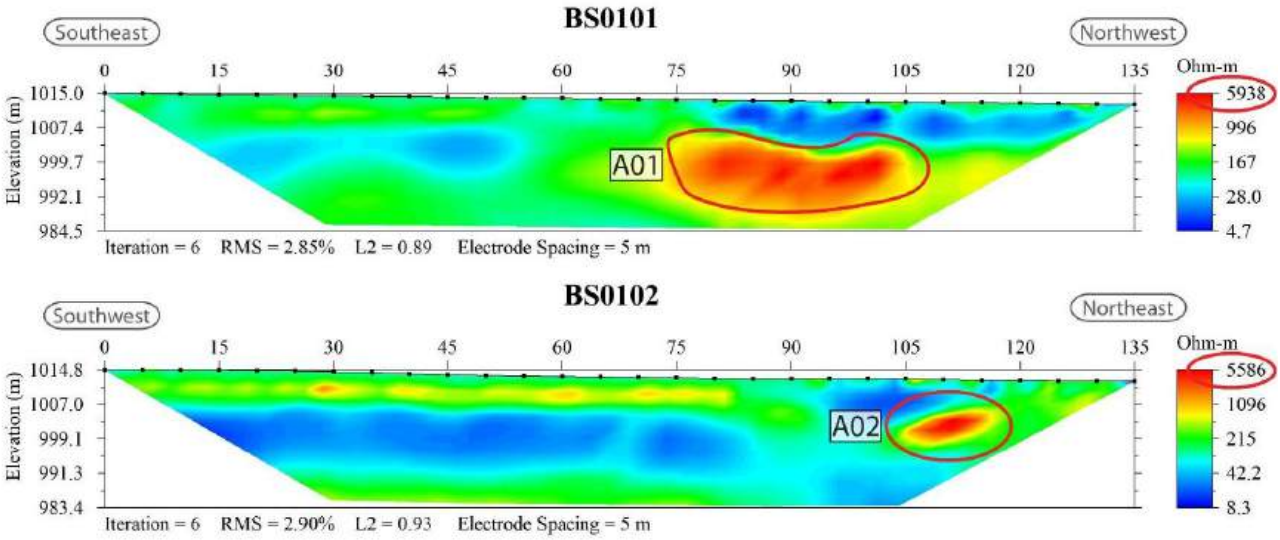

Figure 7: 2D inverted resistivity sections. Reds and oranges indicate higher resistivity values. Yellows and greens are medium-resistivity values. Blues are low-resistivity values.

Table 4 contains a list of anomalies identified during the geophysical survey and subsequent data analysis. Each anomaly is identified with a feature identification number (Feature ID), the type of feature (as interpreted), estimated size (in meters), recommended buffer (in meters), estimated depth from the surface (in meters), feature status modifiers (R for resistivity anomaly, V for field verified), and its location in WGS-84/UTM-13 (EPSG: 32613).

4.0 DISCUSSION

No surface karst features exist within the 200-foot survey boundary. One recognized surface karst feature exists within the 305-meter survey boundary, but outside of the 200-*meter* survey boundary (**Figure 6, Table 3**). Two high-resistivity anomalies initially interpreted to be either subsurface voids or stratigraphically influenced results were subsequently determined to be a high-resistivity gravel lense over low-resistivity clay via a borehole investigation conducted over several days. The borehole investigation utilized both air-rotary and fluid-return drill rigs and a borehole camera (**Figure 7**, **Figure 8** and **Table 4**).

Slightly higher-than-average resistivity areas less than 10 meters beneath the surface are interpreted as dry caliche or gypsite soils. Due to their low resistivity values when compared with significant subsurface voids, these features should not be a concern during remediation efforts. Areas of moderate resistivity (yellows, and greens) near the surface are interpreted as dry caliche soils and dolomite bedrock of the Yates or Tansill Formations[16] (**Figure 7**, **Figure 8**).

The low-resistivity areas between 5 to 20 Ohm-m are interpreted as a layer of either clays, halite lenses, or moist or saturated layers within the Tansill or Yates Formations (**Figure 7**).

Please remember that these are interpretations made from knowledge of the local subsurface materials and experience. **They remain interpretations until verified by geotechnical methods.**

Fracture sets within the subsurface can act as hydrologic pathways to the water table. Rapid dissolution of gypsum can occur along these pathways creating solution-enlarged fractures, and in some cases, voids within months to years. For this reason, this survey is valid only for this remediation event.

Within karst terrains like the project site, small air- or sediment-filled voids and/or brecciated zones and solutionally enlarged fractures that are below the resolution limit of the survey (2.5– 3.0 meters) may exist; these may be encountered during excavation, and if so, should be evaluated by a karst specialist prior to continued work.

5.0 SUMMARY

- **The BS01 survey contains no surface karst features within 200 feet (61 meters) of the spill delineation boundary.**
- One surface karst feature is located outside of the 200-meter survey boundary, but within the 305-meter (1,000 foot) survey boundary.
- **Two subsurface anomalies initially interpreted as voids or related karst features were investigated and found to be stratigraphically related.**
- Intercepting a void during remediation efforts to a depth of four feet is unlikely, but still possible. Small voids or solutionally enlarged fractures below the resolution limit of the survey may be encountered.
- **Well-layered stratigraphy is interpreted to exist beneath the area where the geophysical survey was conducted.**
- When conducting any remediation activities in this area, employing a BLM-CFO approved karst monitor on site should be considered.

6.0 DISCLOSURE STATEMENT

Karst occurrence zones are prone to rapid karst formation and warrant careful planning and engineering to mitigate karst-forming processes that could be accelerated by removal of surface cover or the vibrations associated with heavy equipment used in the remediation process.

Mitigation measures for any karst features revealed during excavation shall be approved by the Bureau of Land Management – Carlsbad Field Office and follow the Natural Resources Conservation Service Conservation Practice Standard for Karst Sinkhole Treatment, Code 527, or the Bureau of Land Management Cave and Karst Management Handbook, H-8380-1.

Vigilance during remediation activities is paramount. If voids are encountered during excavation, contact the Bureau of Land Management Karst Division at (575) 234-5972, the New Mexico State Land Office Surface Resources Division at (505) 827-5768, or a BLM-CFO approved karst contractor and request an on-site investigation from a karst expert if one is not already on site. A karst consultant can generally be available in Eddy County within five hours.

Approved karst monitors should have karst feature identification training, at least two years of supervised experience identifying karst features, wilderness first aid training, SRT training, confined space training, gas monitor training, and a minimum of SPAR cave rescue training through NCRC. They should have with them the proper gear and be prepared both physically and mentally to enter a collapse feature within minutes to perform a rescue if needed.

Monitoring services with qualified karst monitors, as well as cave surveys and geophysical surveys, are available from Southwest Geophysical Consulting.

Under no circumstances should an untrained, inexperienced person enter a cave, pit, sinkhole, or collapse feature. All field employees of Southwest Geophysical Consulting have extensive caving experience and the ability to determine whether entry into a karst feature is safe or presents a hazard. In the event it is necessary to enter a karst feature, Southwest Geophysical Consulting can provide these services on request.

Cave and karst resource inventory reports, karst feature investigations, and geophysical reports commissioned at the request of the land manager should be submitted to:

BLM-CFO: blm_nm_karst@blm.gov

Cave and karst resource inventory reports for the NMSLO should be submitted to the respective project manager.

CAUTION: This email originated outside of our organization. Exercise caution prior to clicking on links or opening attachments.

Good afternoon,

Etech Environmental & Safety Solutions, Inc. (Etech) on behalf of WPX Energy Permian, LLC (WPX), respectfully requests a 90-day extension for a report due for Incident Number nAB1619656595 at the Barbados State #001 SWD (Site).

Since the approval of the Site Characterization and Remediation Plan report, an electrical resistivity imagery (ERI) survey was completed by Southwest Geophysical Consulting to evaluate potential karst features prior to advancing an excavation. The survey results indicated a potential subsurface karst feature, which may be confirmed or otherwise determined not present through further drilling. To provide enough time for permitting and execution of the exploratory borings with a karst monitor, environmental karst report review by the SLO and NMOCD, remediation activities conducted under the appropriate Site Characterization, soil sampling activities, the receipt of laboratory analytical results, backfilling of the excavations, and preparation and submittal of a formal report, Devon requests a 90-day extension of the current March 29, 2025, deadline to August 27, 2025, for Incident Number nAB1619656595.

Thank you,

Erick Herrera

Jim

Documentation of proposed remediation actions for the subject release incident was received from your office on February 27, 2025. The NMSLO Environmental Compliance Office (ECO) has reviewed the plan, and based on the information provided in the document received from your office, ECO has approved the remediation plan with the following conditions:

1. ECO does not approve sampling variance requests for releases where there are sensitive receptors involved. This site is mapped as critical karst. All confirmation samples must be representative of no more than 200 sq ft.
2. ECO agrees with the OCD decision that a liner is not allowed as a means of remediation.

Please submit the remediation closure report to eco@nmslo.gov.

Lessee and/or their contractor are responsible for ensuring the project manager and field personnel performing the work follow the approved work plan.

1.0 INTRODUCTION

An aerial karst survey was commissioned by eTech Environmental and Safety Solutions, Inc. (hereinafter referred to as "the client"), on July 19, 2023, for the purpose of determining the presence of karst-related surface features within the Barbados State #001 SWD project site (hereinafter termed “BARB”).

As indicated in section ***1.3 Affected Environment***, the bedrock and overlying soil at the survey site are susceptible to sinkhole development and karst features may be hidden beneath the existing soil stratum. Risk associated with sinkhole formation can be minimized during remediation by careful excavation of the spill site and the control of site hydrology. The owner/ developer must recognize, however, that a risk of sinkhole-induced damage to infrastructure does exist even after remediation. The owner/developer must evaluate the risks and attendant costs of not performing a geophysical survey prior to remediation and must be willing to accept these risks if it is decided that a surface karst survey is sufficient. Southwest Geophysical Consulting can provide a geophysical survey. If the decision is made to conduct a geophysical survey, a cost estimate and timeline will be provided upon request.

1.1 Goals of this Study

To provide the client with the location and description of any surface karst-related features within the survey boundary for the BARB project site as provided by the client via e-mail (**BARB_PAD_UTM13.shp**) on July 19, 2023

1.2 Summary of Findings

One high-likelihood and three medium-likelihood surface karst features are located within the aerial survey area.

The presence of these and nearby surface features indicates that this area is karstified and may contain buried karst features. Caution should be exercised while clearing brush and during any excavation or remediation operations. Employing a Bureau of Land Management approved karst monitor on site during remediation operations should be considered. Please see the section entitled ***2.4 Description of Karst Features*** and **Table 1** for a full list of the located features.

1.3 Affected Environment

The BARB project is located in evaporite karst terrain, a landform that is characterized by underground drainage through solutionally enlarged conduits. Evaporite karst terrain may contain sinkholes, sinking streams, caves, and springs. Sinkholes leading to underground drainages and voids are common. These karst features, as well as occasional fissures and discontinuities in the bedrock, provide the primary sources for rapid recharge of the groundwater aquifers of the region.

Karst features are delicate resources that are often of geological, hydrological, biological, and archeological importance, and should be protected. The three primary concerns in these types of terrain are environmental issues, worker safety, and infrastructure integrity.

The Bureau of Land Management (BLM) categorizes all areas within the Carlsbad Field Office (CFO) zone of responsibility as having either low, medium, or high cave potential based on geology, occurrence of known caves, density of karst features, and potential impacts to freshwater aquifers[1]. These designations are also recognized by the New Mexico State Land Office (NMSLO). This project occurs within a **HIGH** karst occurrence zone (HKOZ)[2] (**Figure 1**).

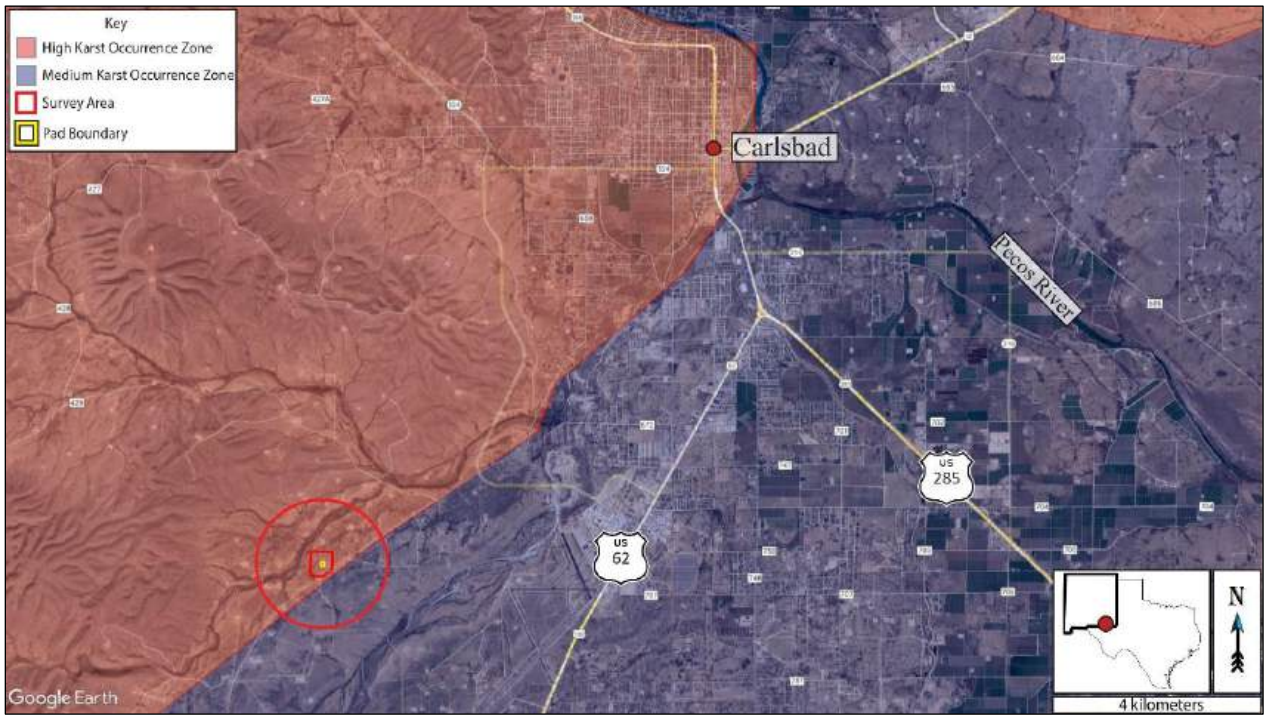

Figure 1: Karst occurrence zone overview. Background image: Google Earth. Image date: December 21, 2019. Datum: WGS-84.

A high karst occurrence zone is defined as an area in known soluble rock types that contains a high frequency of significant caves and karst features such as sinkholes, bedrock fractures that provide rapid recharge of karst aquifers, and springs that provide riparian habitat[1].

1.4 Limitations of Report

This report should be read in full. No responsibility is accepted for use of any part of this report in any other context or for any other purpose or by third parties. This report does not purport to give legal advice. Legal advice can only be given by qualified legal practitioners.

This report has been prepared for the use of eTech Environmental & Safety Solutions, Inc., in accordance with generally accepted consulting practices. Every effort has been made to ensure the information in this report is accurate as of the time of its writing. This report has not been prepared for use by parties other than the client, their contracting party, and their respective advisors. It may not contain sufficient information for the purposes of other parties or for other uses.

This report was prepared upon completion of the associated fieldwork using a standard template prepared by Southwest Geophysical Consulting and is based on information collected prior to fieldwork, conditions encountered on site, and data collected during the fieldwork and reviewed at the time of preparation. Southwest Geophysical Consulting disclaims responsibility for any changes that might have occurred at the site after this time. The interpreted results, locations, and depths noted in this report (if applicable) should be taken as an interpretation only and no decision should be based solely on this information. Physical verification of aerial imagery analysis results in the field should be conducted prior to conducting any remediation activities if these activities will impinge into the recommended buffers.

To the best of our knowledge, information contained in this report is accurate at the date of issue; however, conditions on the site can change in a limited time and, therefore, the information in this report shall not be used beyond three years past the date of imagery collection (see section ***2.3 Description of Survey***).

2.0 LOCATION AND DESCRIPTION OF STUDY AREA

2.1 Description of Site

The BARB project site is located in Eddy County, New Mexico, 11.0 kilometers (6.3 miles) southwest of Carlsbad, New Mexico, north of Hidalgo Rural Road (**Figure 1** and **Figure 2**). The survey area is within section 32 of NM T22S R26E[3]. The region is semi-arid with an average annual precipitation of approximately 13 inches, of which about two-thirds falls as rain during summer thunderstorms from June to October. Summers are hot and sunny while winters are generally mild, with an average maximum temperature of 96°F in July and an average minimum temperature of 28°F in January[4]. This area is within the Chihuahuan Desert Thornscrub as defined by the Southwestern Regional ReGAP Vegetation map[5] and the vegetation consists mostly of areas of grass, sparse creosote, and sparse yucca, with very good visibility in most locations. See section ***2.2 Local Geology*** for the geology of the area. The project site is located entirely within an HKOZ[2] (**Figure 1**) and within NMSLO managed land[6] (**Figure 2**).

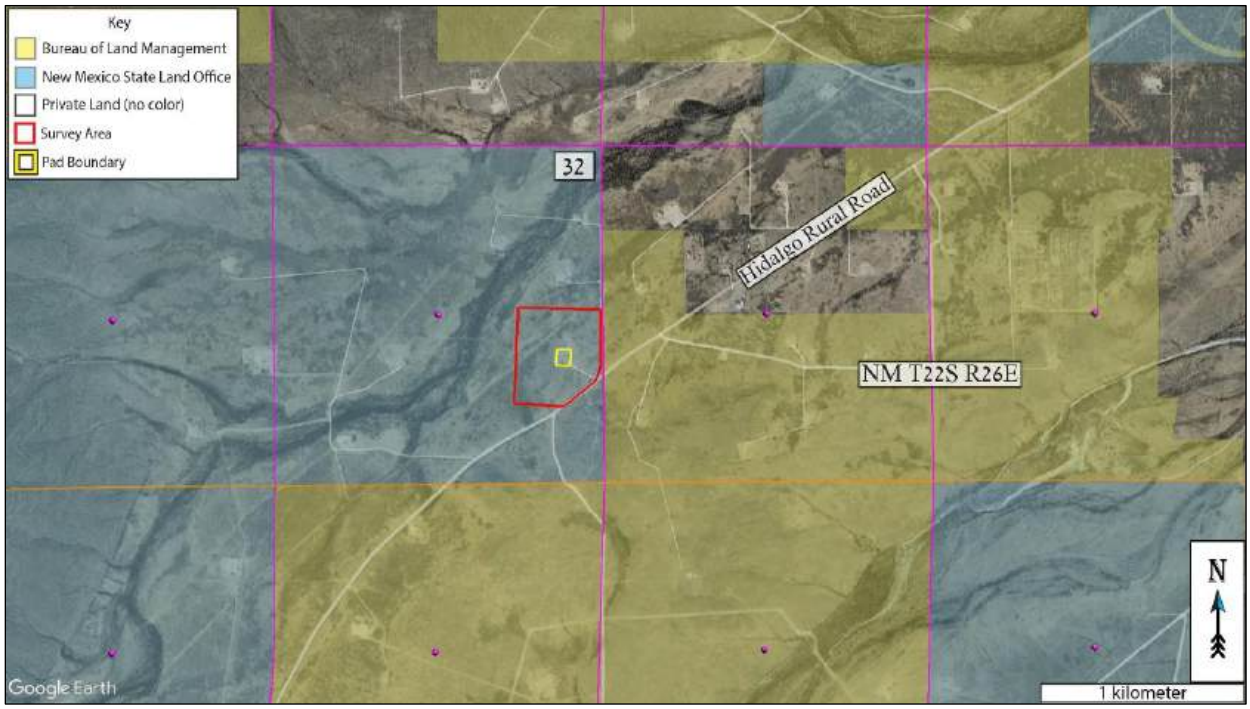

Figure 2: Land ownership[6] and PLSS[3] overview. Background image credit: Google Earth. Image date: December 21, 2019. Datum: WGS-84.

2.2 Local Geology

The area surveyed for the BARB project is located at an elevation of 1,017 meters (3,337 feet), ± 6 meters (19.7 feet), and is underlain by the Permian Artesia Group (Pat) and Permian Salado Formation (Psl). The area is mantled by thin gypsiferous soils and Quaternary aeolian and alluvial sands (Qal)[7] between 0 and 6 meters in depth (**Figure 3**).

The Artesia Group consists of the Greyburg and Queen Formations (Pqg), the Seven Rivers Formation (Psr), the Yates Formation (Py), and the Tansill Formation (Pt)[8]. At this location, the Yates and Tansill Formations immediately underly the Quaternary units. The Tansill Formation is mostly carbonate with minor siltstone and anhydrite. The carbonate is susceptible to karst formation. The Yates Formation is dominated by a quartz-rich, frosted-sandstone facies with minor carbonate, anhydrite, and siltstone. The zones of carbonate and anhydrite are susceptible to karst formation[8]. The Seven Rivers Formation underlies the Yates and Tansill Formations and is a back-reef facies containing interbeds of dolomite and gypsum and occasional sandstone lenses. Both the dolomite and gypsum are subject to karst formation.

The Salado Formation overlies the Artesia Group and contains a layer of extremely soluble halite which can readily dissolve to create caves, sinkholes and other karst features; however, due to its extremely soluble nature, only non-soluble silt and sand remain from the dissolution of this layer at the surface[12].

Figure 3: Geology overview. Map credit: The Digital Geologic Map of New Mexico in ARC/INFO Format[9], and Google Earth. Image date: December 21, 2019. Datum: WGS-84.

This area is karstified and has several karst features within the survey area. Known swallets, sinkholes, and caves exist nearby, but outside the survey area. Caution is recommended during any surface activities including surface inspection, brush clearing, and trenching. The survey area is covered by the easily accessible Geologic Map of New Mexico (2003) at 1:500,000 scale[7].

2.3 Description of Survey

Southwest Geophysical Consulting, in partnership with SWCA Environmental Consultants, provides aerial karst surveys using drones that are flown by qualified, FAA licensed drone pilots and that meet the stringent Bureau of Land Management – Carlsbad Field Office requirements for both pedestrian and aerial karst surveys.

Aerial karst surveys are conducted at low elevation following a preplanned raster pattern flightpath designed for the purpose of generating at least 75% imagery overlap. The collected high-resolution, georeferenced imagery is stitched together to develop orthomosaic imagery which is further developed into a digital elevation model (DEM); the DEM is then processed into a local relief model (LRM) (**Figure 4**). This LRM is color coded to enhance differences in elevation of as little as five centimeters. The orthoimagery, DEM, and LRM are uploaded to a server where they are analyzed by a highly qualified karst geologist. Finally, the data is reviewed by a senior karst geologist for quality assurance and downloaded into a table for inclusion in a written report[10].

Figure 4: Survey overview. Background image credit: Google Earth. Image date: December 21, 2019. Datum: WGS-84.

Resolution of the orthoimagery is clear enough that features as small as 10 centimeters can be positively identified in most circumstances. Occasionally there are ambiguous features identified during an aerial survey that will need to be checked in the field if they impact the facility's location. Specifically, it is difficult to tell the difference between solution tubes, abandoned uncased well bores, and some burrows in drone imagery[11]. These features are marked with yellow dots in **Figure 4**. If a feature is subsequently verified in the field prior to publication of the report, the dot will be changed to red triangle if confirmed as a karst feature or deleted if not.

The imagery for the BARB study was collected via aerial survey by Pat Lagodney of SWCA on August 23, 2023. Surface karst features may have developed after this date and will not be noted in this report. Imagery analysis was completed by Garrett Jorgensen Olague of Southwest Geophysical Consulting on September 6, 2023.

Prior to conducting the aerial karst surveys, a surface karst desk study was performed by Southwest Geophysical Consulting. The study was performed using satellite and aerial imagery from Google Earth Pro dated December 21, 2019 (please note features less than one meter in diameter are generally not visible); the Southwest Geophysical Cave and Karst Database dated August 21, 2023; and the Kitchen Cove, NM, 1:24,000 quad, 1985, USGS topographic map. Please note that we use older topographic maps because newer maps have had caves removed from them. These searches and queries returned no results within the survey boundary.

2.4 Description of Karst Features

One high-likelihood surface karst feature is located within the aerial survey area (**Figure 4**, **Table 1**). High-likelihood surface karst features are features that are positively identified in either satellite or aerial imagery as karst features but have not been field checked.

Three medium-likelihood surface karst features are located within the aerial survey area (**Figure 4**, **Table 1**). Medium-likelihood surface karst features are ambiguous in aerial imagery and should be site-checked for verification if they impact the facility's location. The features identified in this report as medium likelihood are probably burrows or shadows, or erosional in nature; however, there is insufficient evidence to make this determination and therefore these features cannot be ruled out.

These features and any potential hydrologic pathways into them should be considered during site and remediation planning (**Figure 4**, see section **3.0 RECOMMENDATIONS** for further information).

Caution should be exercised while operating in or around all karst-related features due to the possibility of near-surface voids. Please be aware that the area may contain buried karst features outside of these areas. Caution is advised while clearing brush and during trenching and excavation activities outside of these zones. Employing a BLM-CFO approved karst monitor on site during these activities should be considered.

Table 1 contains a list of features identified during the aerial karst survey and subsequent imagery analysis. Each feature is identified with a feature identification number (Feature ID), the type of feature, estimated size (in meters), recommended buffer (in meters), the likelihood of this feature being a surface karst feature (modifiers H/M for high or medium likelihood, V for field verified), and its location in WGS-84/UTM-13 (EPSG: 32613).

3.0 RECOMMENDATIONS

3.1 Summary

- One high-likelihood and three medium-likelihood surface karst features are located within the aerial survey area (**Figure 4**, **Table 1**).
- **Consider these features and whether surface flow may impact or has already impacted them during site and remediation planning** (**Figure 4**)**.**
- The presence of these and other nearby surface karst features indicates that this area is karstified and may contain buried karst features.
- Caution should be exercised while clearing brush and during any excavation, trenching, drilling, or remediation operations.
- Employing a BLM-CFO approved karst monitor during excavation or remediation operations near these features should be considered.

3.2 Best Practices

Because of the ambiguous nature of the medium-likelihood surface karst features found in the survey area, caution should be used while working in or near feature buffer zones. **Please be advised that any remediation operations conducted within a medium-likelihood surface karst feature buffer will require a field verification by a BLM-CFO approved karst vendor to confirm the nature of these features.**

This area may be prone to rapid karst formation in the underlying stratigraphy and warrants careful planning and engineering to mitigate karst-forming processes that could be accelerated by poor planning and considerations. Proper practices following karst guidelines should be implemented during all phases of remediation. Mitigation measures for any karst features revealed during excavation or drilling shall be approved by the Bureau of Land Management – Carlsbad Field Office and follow the Natural Resources Conservation Service Conservation Practice Standard for Karst Sinkhole Treatment, Code 527, or the Bureau of Land Management Cave and Karst Management Handbook, H-8380-1.

Keep in mind that any flow of gypsum-undersaturated waters into a small crack or crevice can rapidly dissolve any underlying gypsum and cause failure of an impoundment or infrastructure within a matter of months to a few years.

Vigilance during remediation is paramount. If voids are encountered during excavation or drilling, contact the Bureau of Land Management Karst Division at (575) 234-5972, the New Mexico State Land Office Surface Resources Division at (505) 827-5768, or a BLM-CFO approved karst vendor and request an on-site investigation from a karst expert if one is not already on site. A karst consultant can generally be available in Eddy County within five hours.

Approved karst monitors should have karst feature identification training, at least two years of supervised experience identifying karst features, wilderness first aid training, SRT training, confined space training, gas monitor training, and a minimum of SPAR cave rescue training through NCRC. They should have with them the proper gear and be prepared both physically and mentally to enter a collapse feature within minutes to perform a rescue if needed. Monitoring services with qualified karst monitors, as well as cave surveys and geophysical surveys, are available from Southwest Geophysical Consulting.

Under no circumstances should an untrained, inexperienced person enter a cave, pit, sinkhole, or collapse feature. All field employees of Southwest Geophysical Consulting have extensive caving experience and the ability to determine whether entry into a karst feature is safe or presents a hazard. In the event it is necessary to enter a karst feature, Southwest Geophysical Consulting can provide these services on request.

Cave and karst resource inventory reports for the BLM-CFO should be submitted to:

blm_nm_karst@blm.gov

Cave and karst resource inventory reports for the NMSLO should be submitted to the respective project manager.

1.0 INTRODUCTION

This report was commissioned by eTech Environmental & Safety Solutions, Inc. (hereinafter referred to as "the client"), on March 6, 2025, for the purpose of conducting an environmental karst study within an area encompassing the Barbados State No. 001 SWD site (hereinafter termed “BS01”) centered at N 32.346833° W 104.309131°.

1.1 Goals of this Study

The goals of this study are to conduct a surface karst inventory and provide the client with the location and description of any surface karst features located within 200 feet (61 meters) of the spill delineation boundary (as defined by 19.15.29.12 NMAC[1]) and to determine whether stable ground exists (as defined by 19.15.2 NMAC Definitions[2]) within the spill boundary of the Barbados State 001 release using electrical resistivity imaging[3].

1.2 Summary of Findings

- **No surface karst features exist within the 200-foot (61-meter) zone surrounding the spill delineation boundary.**
- **Two anomalies consistent with air-filled voids are located within the BS01 resistivity survey area, indicating the zone beneath the geophysical survey may be subject to collapse.**
- **Well-layered stratigraphy is interpreted to exist beneath the area where the geophysical survey was conducted; however, due to the interpreted subsurface voids, this area cannot be considered stable ground.**
- **Employing a Bureau of Land Management approved karst monitor on-site during excavation is recommended.**

1.3 Affected Environment

The BS01 project site is located in evaporite karst terrain, a landform that is characterized by underground drainage through solutionally enlarged conduits. Evaporite karst terrain may contain sinkholes, sinking streams, caves, and springs. Sinkholes leading to underground drainages and voids are common. These karst features, as well as occasional fissures and discontinuities in the bedrock, provide the primary sources for rapid recharge of the groundwater aquifers of the region. Additionally, karst may develop by hypogene processes involving dissolution by upwelling fluids from depth independent of recharge from the overlying or immediately adjacent surface. Hypogene karst systems may not be connected to the surface and can remain undiscovered unless encountered during drilling or excavation.

Karst features are delicate resources that are often of geological, hydrological, biological, and archeological importance, and should be protected. The four primary concerns in these types of terrain are environmental issues, worker safety, equipment damage, and infrastructure integrity.

The Bureau of Land Management (BLM) categorizes all areas within the Carlsbad Field Office (CFO) zone of responsibility as having either low, medium, high, or critical cave potential based on geology, occurrence of known caves, density of karst features, and potential impacts to freshwater aquifers[4]. These designations are also recognized by the New Mexico State Land Office (NMSLO). This project occurs within a **CRITICAL** karst occurrence zone (CKOZ)[5] (**Figure 1**).

A critical karst occurrence zone is defined as an area in known soluble rock types with high density of significant cave systems and/or bedrock fractures that lead to the rapid recharge of karst groundwater aquifers from surface runoff. These areas provide critical drinking water supplies for major communities and ranching operations, and supply springs that support rivers and vital riparian habitats[4].

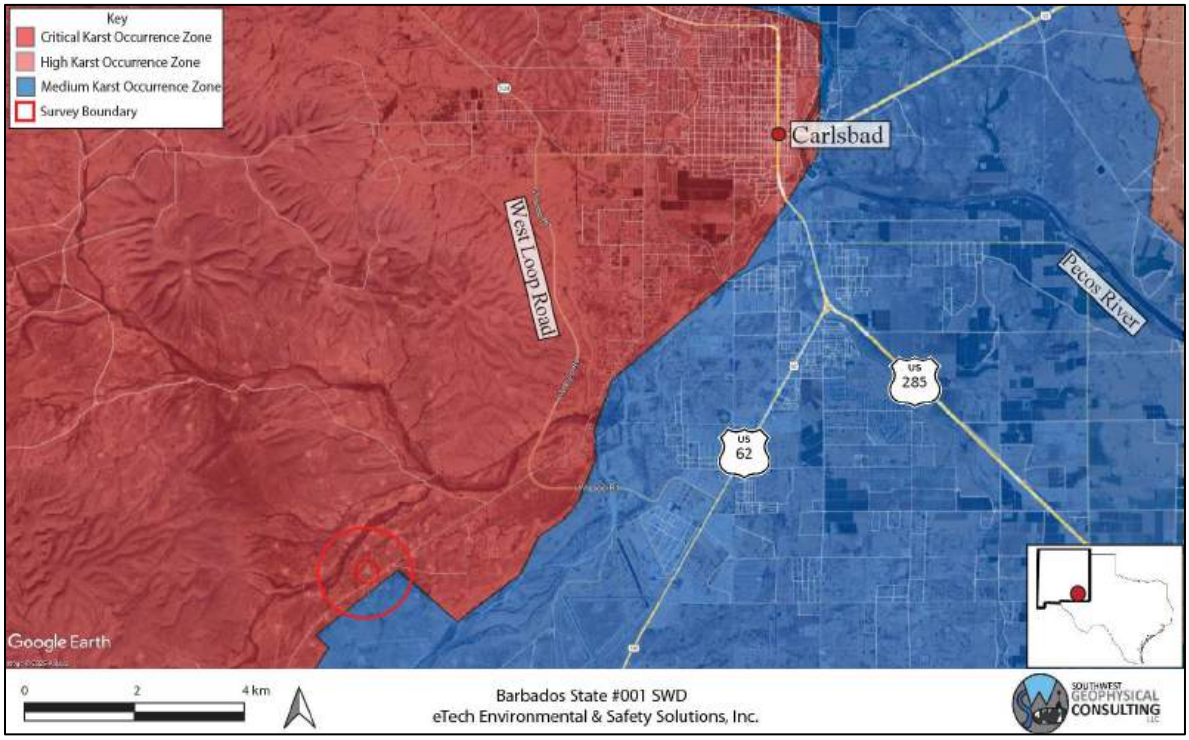

Figure 1: Karst occurrence zone overview. Background image credit: Google Earth. Image date: March 7, 2023. Image datum: WGS-84.

Due to the rapidity with which evaporite karst develops, each location within a BLM-CFO designated karst occurrence zone must be assessed on an individual basis to determine the existence of surface karst features and the possibility of sub-surface karst development each time a release occurs.

1.4 Limitations of Report

This report should be read in full. No responsibility is accepted for the use of any part of this report in any other context or for any other purpose or by third parties. This report does not purport to give legal advice. Legal advice can only be given by qualified legal practitioners.

This report has been prepared for the use of eTech Environmental & Safety Solutions, Inc., in accordance with generally accepted consulting practices. Every effort has been made to ensure the information in this report is accurate as of the time of its writing. This report has not been prepared for use by parties other than the client, their contracting party, and their respective consulting advisors. It may not contain sufficient information for the purposes of other parties or for other uses.

This report was prepared upon completion of the associated fieldwork using a standard template prepared by Southwest Geophysical Consulting and is based on information collected prior to fieldwork, conditions encountered on site, and data collected during the fieldwork and reviewed at the time of preparation. Southwest Geophysical Consulting disclaims responsibility for any changes that might have occurred at the site after this time. The interpreted results, locations, and depths noted in this report (if applicable) should be taken as an interpretation only and no decision should be based solely on this information. Physical verification of aerial imagery analysis results should be conducted in the field prior to using this information for remediation planning. Physical verification of geophysical results using geotechnical methods should be conducted.

To the best of our knowledge, the information contained in this report is accurate at the date of issue. Due to the nature of karst terrain, the information in this report shall not be used beyond two years past the dates of the field work provided in section ***2.3 Description of Survey***. Large weather events can shorten this time period as areas subject to karst development can rapidly form new features subsequent to these events.

2.0 LOCATION AND DESCRIPTION OF STUDY AREA

2.1 Description of Site

The site is located 10.9 kilometers (6.8 miles) southwest of Carlsbad, New Mexico, north of Hidalgo Rural Road and southwest of West Loop Road. The release area is located within section 32 of NM T22S R26E[6] (**Figure 1** and **Figure 2**). The region has rolling terrain with karstification occurring in the gypsite soils and underlying gypsum and dolomite bedrock[7] (see section ***2.2 Local Geology Summary*** for further information). The climate in this area of southeast New Mexico is semi-arid with an average annual precipitation of approximately 13 inches, of which about two-thirds falls as rain during summer thunderstorms from June to October. Summers are hot and sunny while winters are generally mild, with an average maximum temperature of 96°F in July and an average minimum temperature of 28°F in January[8]. This area is within the Chihuahuan Desert Thornscrub as defined by the Southwestern Regional ReGAP Vegetation map[9] and the vegetation consists mostly of areas of blue grama, nine-awned pappus grass, burro grass and low scrub including yucca. The spill delineation boundary is located within a CKOZ[5] (**Figure 1**) and NMSLO managed land[10] (**Figure 2**).

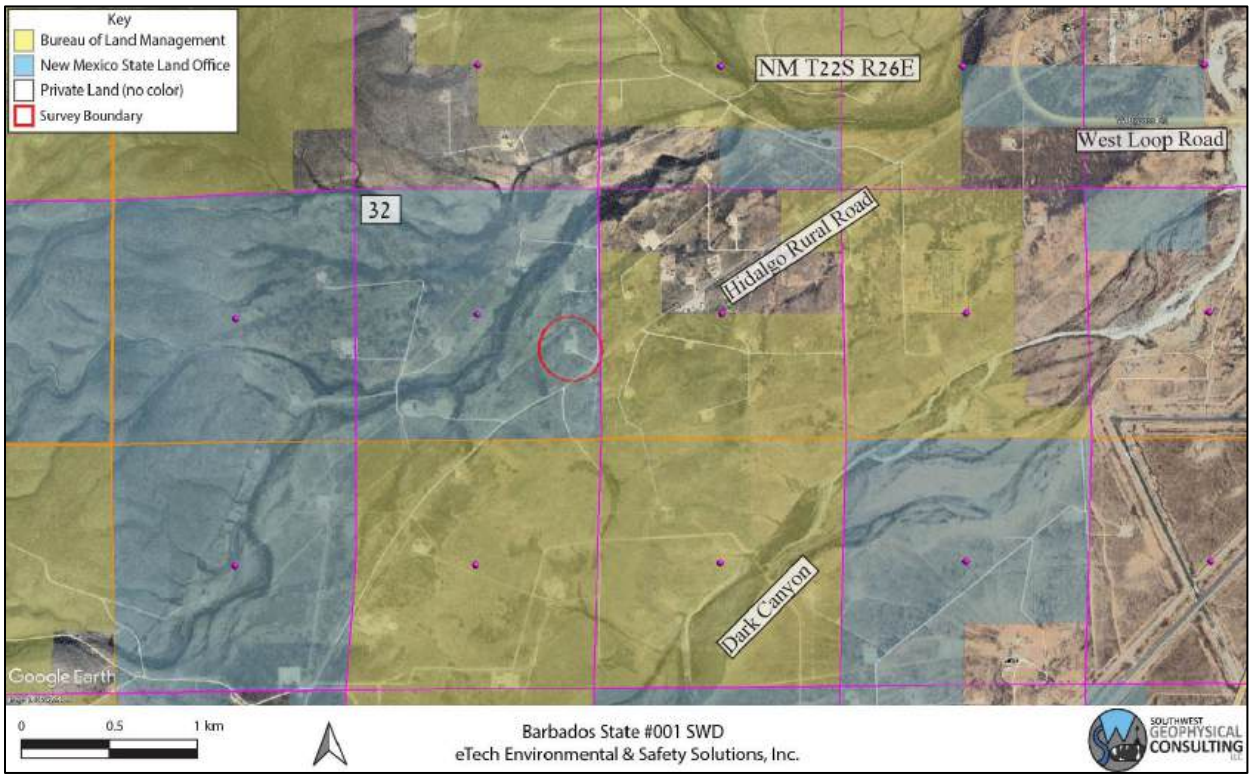

Figure 2: Land ownership and PLSS overview. Background image credit: Google Earth. Image date: March 7, 2023. Image datum: WGS-84.

2.2 Local Geology Summary

The site for the BS01 survey is located at an elevation of 1,015 meters (3,331 feet), ± 3 meters (9.8 feet). This region is underlain by the undivided Permian Tansill and Yates Formation (Pty). The area is mantled by thin calcareous soils (caliche) and piedmont gravels (Qp)[11] up to 5 meters in depth (**Figure 3**).

The Tansill Formation is mostly carbonate with minor siltstone and anhydrite. East of Highway 285 and along the Pecos River, the Tansill is predominantly dolomite. In places where the dolomitic beds are exposed, the contact with the overlying Salado gypsum and siltstone can also be seen. Both of the dolomitic and gypsiferous facies in the Tansill are prone to karst development[12].

The Yates Formation is dominated by a quartz-rich, frosted-sandstone facies with minor carbonate, anhydrite, and siltstone. Northwest of Carlsbad, there is a near-reef facies with inter-tongued carbonates and evaporites. The lower section of the Yates transitions with the upper portion of the Seven Rivers Formation. This area consists of dolomite interbedded with siltstone, fine-grained sandstone, and minor gypsiferous siltstone beds that are prone to karst development[12].

The survey area is covered by the easily accessible Geologic Map of New Mexico (2003) at 1:500,000 scale[13] and the Digital Geologic Map of New Mexico in ARC/INFO Format[11].

2.3 Description of Survey

2.3.1 Surface Karst Survey

Southwest Geophysical Consulting, in partnership with SWCA Environmental Consultants, provides surface karst surveys using small, uncrewed aerial systems (sUAS) that are flown by qualified, FAA licensed drone pilots and that meet the stringent Bureau of Land Management – Carlsbad Field Office requirements for both pedestrian and aerial karst surveys.

The surface karst survey includes a desk study prior to the flight which allows us to provide client feedback in the event of any previously known karst features in the area. The desk study is performed out to 305 meters (1,000 feet) from the spill delineation boundary per New Mexico Oil Conservation Division guidance[1] (**Figure 4**). The study was performed using satellite and aerial imagery from Google Earth Pro dated March 7, 2023 (please note features less than one meter in diameter are generally not visible using this method); the Southwest Geophysical Cave and Karst Database dated March 20, 2025[14]; the Kitchen Cove, NM, 1:24,000 quad, 1985, USGS topographic map; and the latest lidar imagery from CalTopo.com. Please note that we use older topographic maps because newer maps have had caves removed from them. These searches and queries returned no previously recorded karst features within the 305-meter survey boundary.

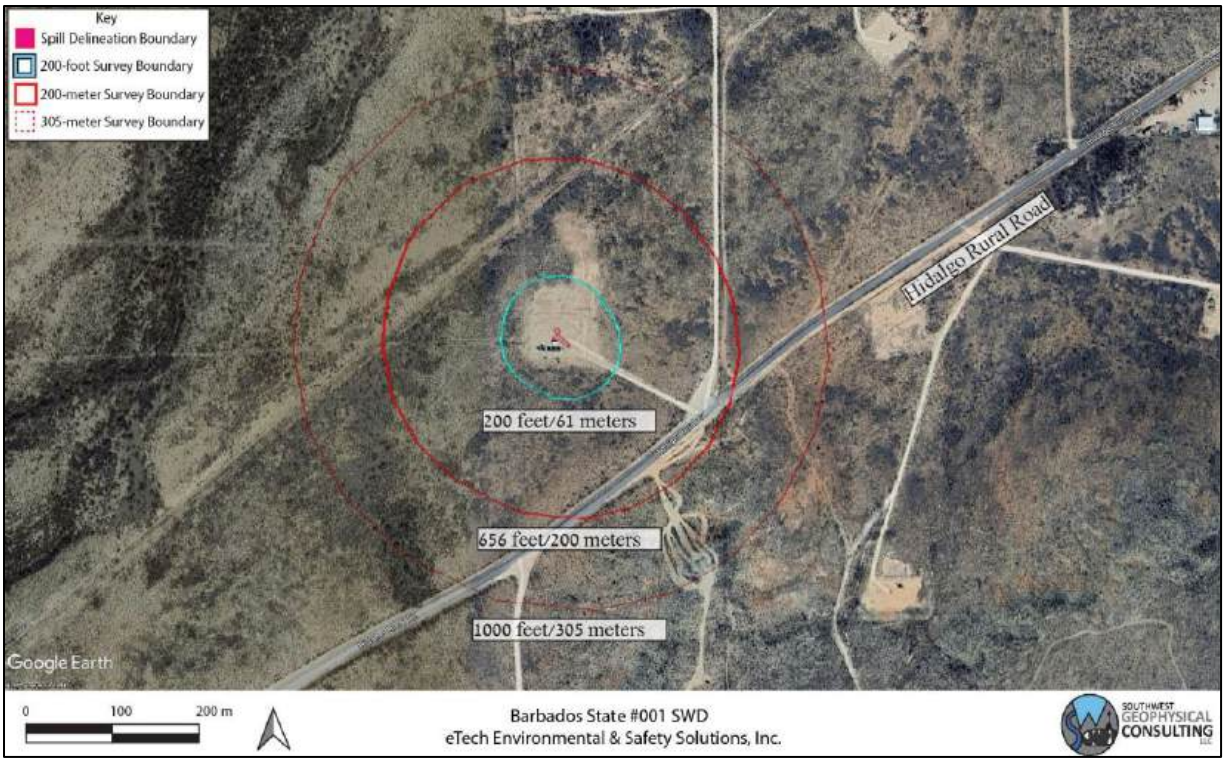

Figure 4: Surface survey overview. Background image credit: Google Earth. Image date: March 7, 2023. Datum: WGS-84.

Surface karst surveys are conducted by sUAS at low elevation within 200 meters of the spill delineation boundary[4] (**Figure 4**) following a preplanned raster pattern flightpath designed for the purpose of generating at least 75% imagery overlap. The collected high-resolution, georeferenced imagery is stitched together to develop orthomosaic imagery which is further developed into a digital elevation model (DEM); the DEM is then processed into a local relief model (LRM) (**Figure 6**). This LRM is color coded to enhance differences in elevation of as little as five centimeters. The orthoimagery, DEM, and LRM are uploaded to a server where they are analyzed by an experienced karst geologist. Finally, the data is reviewed by a senior karst geologist for quality assurance and downloaded into a table for inclusion in a written report[15].

The resolution of the orthoimagery is clear enough that features as small as 10 centimeters can be positively identified in most circumstances. Occasionally there are ambiguous features identified during an aerial survey that will need to be checked in the field if they are impacted by the proposed remediation efforts. Specifically, it is difficult to tell the difference between solution tubes, abandoned uncased well bores, and some burrows in drone imagery. If an ambiguous feature is located during imagery analysis, it is marked with a yellow dot in **Figure 6**. If a feature of any likelihood is subsequently verified in the field prior to publication of the report, the dot will be changed to a red triangle if confirmed as a karst feature or deleted if not.

The imagery for this study was collected via aerial survey by Pat Lagodney of SWCA on August 23, 2023. Surface karst features may have developed after this date and will not be noted in this report. Imagery analysis was completed by Garrett Jorgensen Olague of Southwest Geophysical Consulting on September 6, 2023. **NOTE:** a surface karst survey was commissioned by the client on July 19, 2023. These surface karst survey results were originally reported in report number ETEC-002-20230719.

2.3.2 Geophysical Survey

For this survey, an Advanced Geosciences Inc. (AGI) SuperSting™ Wifi R8 with a multi-electrode switchbox, a 28-electrode array of 40-centimeter-long electrodes, and a tablet controller were used to image the subsurface. This survey consisted of two resistivity lines in a dipole-dipole strong-gradient configuration; line one is laid out southeast to northwest while line two is laid out southwest to northeast. Both lines consisted of 28 electrodes at 5-meter spacing, resulting in 135-meter-long arrays (**Figure 5**, **Table 1**). A preconfigured command file was used to run the data collection (DDSG28). This electrode configuration provided a depth of investigation of 27 meters (89 feet) and a resolution of 2.5 to 3.0 meters (8.2 to 9.8 feet) within the first 5 to 8 meters (16 to 26 feet) from the surface. A Leica GS18 GPS was used to record electrode locations and elevations.

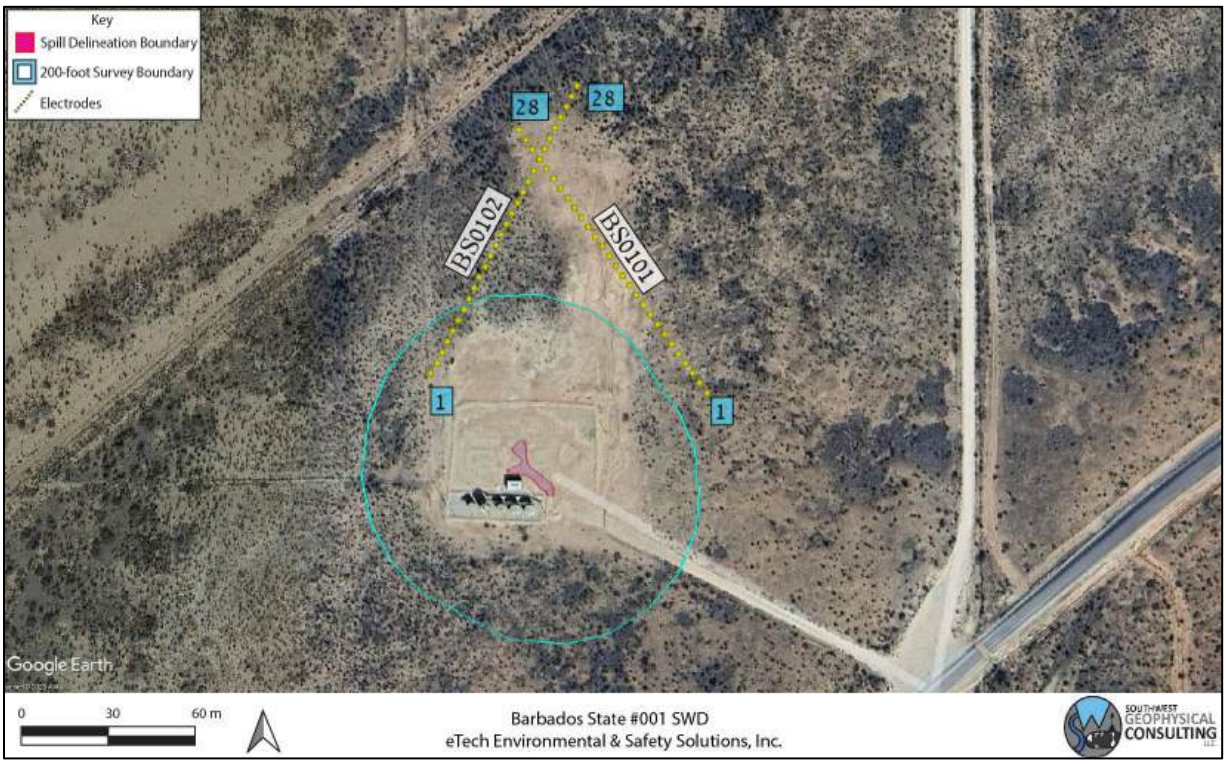

Figure 5: Geophysical survey overview. Two survey lines were conducted with 28 electrodes each at 5-meter spacing (yellow dots denoted with blue numbers). Background image credit: Google Earth. Image date: March 7, 2023. Image datum: WGS-84.

Table 1 provides basic line data. Detailed information including electrode number, location in latitude/longitude (decimal degree format), and elevation in meters can be found in the accompanying data files.

Table 1: Survey Line Data Table. The .kmz file contains all the points for the survey line listed in the file name. These data are available in the accompanying files BS01 _ERI_Points.xlsx and ETEC-012-20250306_BS01_Data_Files.kmz.

EarthImager™ 2D software was used to download and process the data and to provide the model used to make our interpretations. The design of the survey and the orientation of each of the lines provides the information necessary to make the determination of "stable" or "unstable" ground at this site.

A typical starting model was used for the data processing due to the two-layer model of the geology in the area; specifically, generally high-resistivity gypsum and dolomite at the surface and low-resistivity saturated gypsum and dolomite bedrock at depth. The starting model used was "average apparent resistivity" and a default inversion setting of "surface," with a minimum apparent resistivity set to 0.1 Ohm-meters (Ohm-m or Ω-m) and a max apparent resistivity set to 100,000 Ω-m (**Table 2**).

Note: Raw data files (.stg files for EarthImager™ 2D) and processed data (.trn files, terrain files for surface correction in EarthImager™ 2D and .out files, the processed .stg files) are available upon request.

All geophysical field work, including setup, stow, and travel, was completed by Garrett Jorgensen Olague, Britt Bommer, and Michael Jones on April 9, 2025.

3.0 RESULTS

3.1 Surface Karst Survey

The desk study and surface karst survey showed no surface karst features within the 200-foot (61-meter)[1] survey area surrounding the spill delineation boundary (**Figure 6**).

One recognized surface karst feature is located within the 305-meter survey boundary, but outside of the 200-*meter* surface karst survey boundary (**Figure 6**, **Table 3**). Recognized surface karst features are features that are positively identified in either satellite or aerial imagery as karst features and the features have been visited by a qualified karst professional in the field and fully identified. Images for this feature are available on request.

No springs exist within the 305-meter survey boundary (**Figure 6**).

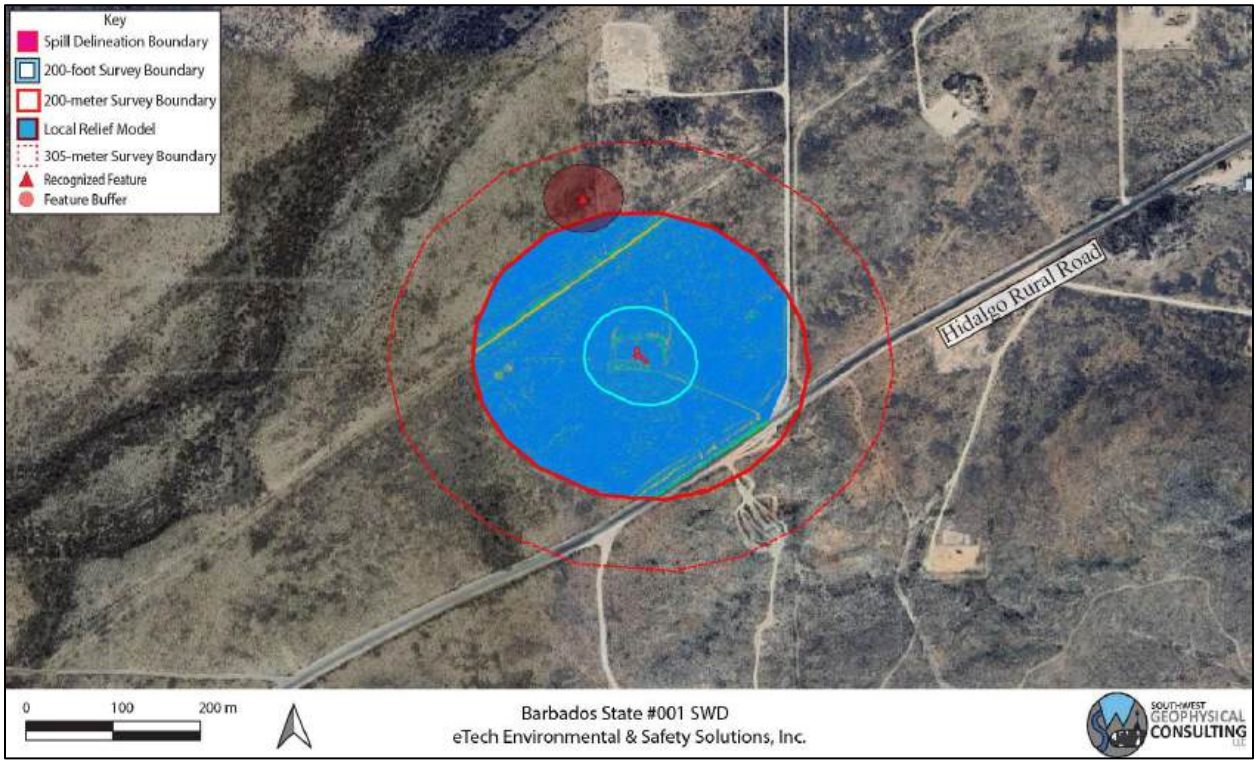

Figure 6: Surface karst survey results. Background image credit: Google Earth. Image date: March 20, 2023. Image datum: WGS-84.

Caution should be exercised while operating in or around all karst-related features due to the possibility of near-surface voids. Employing a BLM-CFO approved karst monitor on site during these activities is recommended.

Table 3 contains a list of features identified during the aerial karst survey and subsequent imagery analysis. Each feature is identified with a feature identification number (Feature ID), the type of feature, estimated size (in meters), recommended buffer (in meters), the likelihood of this feature being a surface karst feature (modifiers H/M for high or medium likelihood, V for field verified), and its location in WGS-84/UTM-13 (EPSG: 32613).

3.2 Geophysical Survey

Electrical resistivity tomography forms images of the subsurface by causing a current to flow through the rock and soil and then measuring the resistance of these materials as the current flows through them. This measurement is taken many times and the resulting data, once processed, is used to produce a model of the subsurface (**Figure 7**). This model is produced using "non-unique" solutions, which means that there are many models and interpretations which will satisfy the data. Using experience and knowledge of the local geology, a high-confidence model can be established and used to develop an accurate understanding of what lies below the surface. This survey was conducted with the express purpose of locating subsurface voids and does not purport to find paleokarst (old, non-active karst features that have been filled in with sand and sediment) or nascent karst features below the resolution limit of the survey.

The results of this study indicate a well-layered geologic system with resistivities between 5 and 1,100 Ohm-m (**Figure 7**). Two high-resistivity anomalies are present, one on each line. These anomalies have resistivities of 5,938 and 5,586 Ohm-m, respectively. Please keep in mind when viewing the 2D inverted resistivity sections that color maps can be widely different for each view. Always check the color map located on the right side of the image when viewing the 2D images to ensure you understand the range of resistivities presented. Distances along the top and depths along the left side are in meters. The color map along the right side is in Ohm-m. Due to the nature of the survey, shallower zones have higher resolution between electrodes than deeper zones; therefore, small features at depth will not be visible.

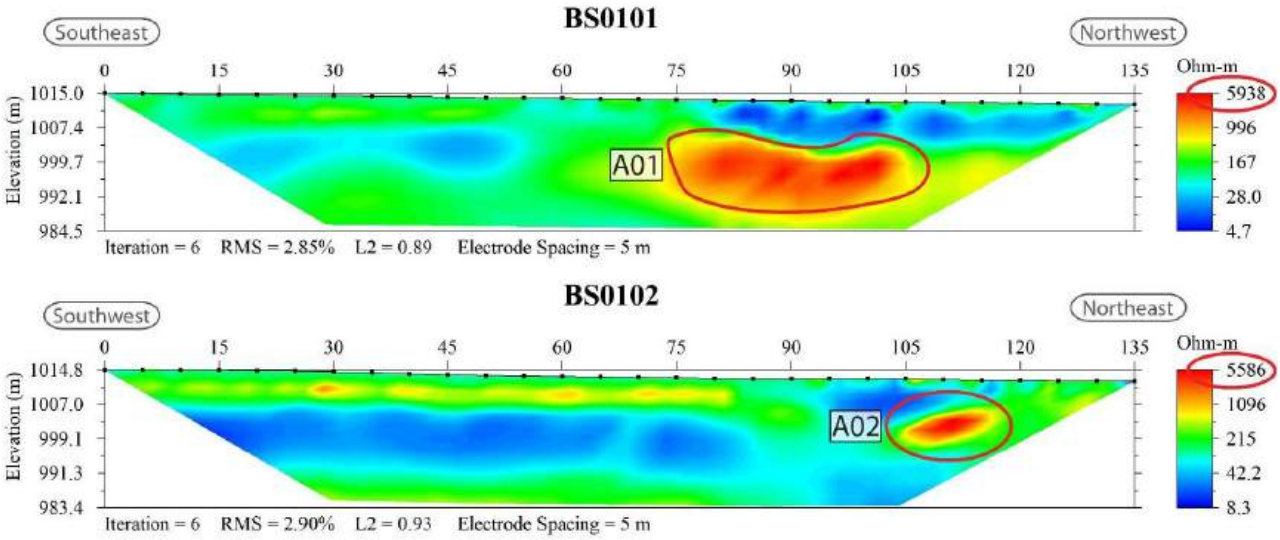

Figure 7: 2D inverted resistivity sections. Reds and oranges indicate higher resistivity values. Yellows and greens are medium-resistivity values. Blues are low-resistivity values.

Table 4 contains a list of anomalies identified during the geophysical survey and subsequent data analysis. Each anomaly is identified with a feature identification number (Feature ID), the type of feature (as interpreted), estimated size (in meters), recommended buffer (in meters), estimated depth from the surface (in meters), feature status modifiers (R for resistivity anomaly, V for field verified), and its location in WGS-84/UTM-13 (EPSG: 32613).

Table 4: Subsurface Anomaly Data Table

KF Status	Feature ID	Type	Size (m)	Buffer (m)	Mod	Depth (m)	Easting	Northing

4.0 DISCUSSION

One recognized surface karst feature (**Figure 6, Table 3**) and two anomalies consistent with air-filled subsurface voids are found within the BS01 survey area (**Figure 7**, **Figure 8** and **Table 4**) indicating karst development in the area. These anomalies may represent multiple air-filled voids at or below the resolution limit of the survey (2.5 – 3.0 meters), or a single continuous solutionally enlarged fracture.

Slightly higher-than-average resistivity areas less than 10 meters beneath the surface are interpreted as dry caliche or gypsite soils. Due to their low resistivity values when compared with significant subsurface voids, these features should not be a concern during remediation efforts. Areas of moderate resistivity (yellows, and greens) near the surface are interpreted as dry caliche soils and dolomite bedrock of the Yates or Tansill Formations[16] (**Figure 7**, **Figure 8**).

The low-resistivity areas between 5 to 20 Ohm-m are interpreted as a layer of either clays, halite lenses, or moist or saturated layers within the Tansill or Yates Formations (**Figure 7**).

Please remember that these are interpretations made from knowledge of the local subsurface materials and experience. **They remain interpretations until verified by geotechnical methods. We recommend drilling one or both of the anomalies to verify our interpretations before using this information for remediation planning purposes.** Employing a BLM-CFO approved karst monitor on site during any drilling and/or remediation activities is recommended.

Fracture sets within the subsurface can act as hydrologic pathways to the water table. Rapid dissolution of gypsum can occur along these pathways creating solution-enlarged fractures, and in some cases, voids within months to years. For this reason, this survey is valid only for this remediation event.

Within karst terrains like the project site, small air- or sediment-filled voids and/or brecciated zones and solutionally enlarged fractures that are below the resolution limit of the survey (2.5– 3.0 meters) may exist; these may be encountered during excavation, and if so, should be evaluated by a karst specialist prior to continued work.

5.0 SUMMARY

- **The BS01 survey contains no surface karst features within 200 feet (61 meters) of the spill delineation boundary.**
- One surface karst feature is located outside of the 200-meter survey boundary, but within the 305-meter (1,000 foot) survey boundary.
- **Two subsurface anomalies interpreted as large voids or related karst features that may present a danger to equipment operators are located within the survey area.**
- **Geophysical interpretations should be field verified by geotechnical methods prior to using this information for remediation planning.**
- Intercepting a void during remediation efforts to a depth of four feet is unlikely, but still possible. Small voids or solutionally enlarged fractures below the resolution limit of the survey may be encountered.
- **Well-layered stratigraphy is interpreted to exist beneath the area where the geophysical survey was conducted; however, the presence of anomalies interpreted as subsurface voids may indicate unstable ground.**
- When conducting any remediation activities in this area, employing a BLM-CFO approved karst monitor on site is recommended.

6.0 DISCLOSURE STATEMENT

Karst occurrence zones are prone to rapid karst formation and warrant careful planning and engineering to mitigate karst-forming processes that could be accelerated by removal of surface cover or the vibrations associated with heavy equipment used in the remediation process.

Mitigation measures for any karst features revealed during excavation shall be approved by the Bureau of Land Management – Carlsbad Field Office and follow the Natural Resources Conservation Service Conservation Practice Standard for Karst Sinkhole Treatment, Code 527, or the Bureau of Land Management Cave and Karst Management Handbook, H-8380-1.

Vigilance during remediation activities is paramount. If voids are encountered during excavation, contact the Bureau of Land Management Karst Division at (575) 234-5972, the New Mexico State Land Office Surface Resources Division at (505) 827-5768, or a BLM-CFO approved karst contractor and request an on-site investigation from a karst expert if one is not already on site. A karst consultant can generally be available in Eddy County within five hours.

Approved karst monitors should have karst feature identification training, at least two years of supervised experience identifying karst features, wilderness first aid training, SRT training, confined space training, gas monitor training, and a minimum of SPAR cave rescue training through NCRC. They should have with them the proper gear and be prepared both physically and mentally to enter a collapse feature within minutes to perform a rescue if needed. Monitoring services with qualified karst monitors, as well as cave surveys and geophysical surveys, are available from Southwest Geophysical Consulting.

Under no circumstances should an untrained, inexperienced person enter a cave, pit, sinkhole, or collapse feature. All field employees of Southwest Geophysical Consulting have extensive caving experience and the ability to determine whether entry into a karst feature is safe or presents a hazard. In the event it is necessary to enter a karst feature, Southwest Geophysical Consulting can provide these services on request.

Cave and karst resource inventory reports, karst feature investigations, and geophysical reports commissioned at the request of the land manager should be submitted to:

BLM-CFO: blm_nm_karst@blm.gov

Cave and karst resource inventory reports for the NMSLO should be submitted to the respective project manager.

rhamlet	The Remediation Plan is Conditionally Approved. The “Environmental Karst Study Report – Barbados State No. 001 SWD” will be accepted for record and placed in the incident files for future reference. The SDNP survey area contains no surface karst features within 200 feet (61 meters) of the spill delineation boundary provided by the client. Karst occurrence zones are prone to rapid karst formation and warrant careful planning and engineering to mitigate karst-forming processes that could be accelerated by removal of surface cover or the vibrations associated with heavy equipment used in the remediation process. When conducting any remediation activities in this area, employing a BLM-CFO approved karst monitor on site should be considered. In New Mexico, karst surveys are generally valid for a period of three years due to the dynamic and unpredictable nature of karst areas.	12/19/2025
rhamlet	Floor confirmation samples should be delineated/excavated to meet closure criteria standards from Table 1 of the OCD Spill Rule for site receptor characterization/proven depth to water determination. If any part of the release area is located within a 100-year floodplain, the entire release will need to be remediated to the strictest closure criteria from Table 1 of the OCD Spill Rule. Samples must be analyzed for all constituents listed in Table I of 19.15.29.12 NMAC. Confirmation samples should be collected every 200 ft2. Sidewall samples should be delineated/excavated to 600 mg/kg for chlorides and 100 mg/kg for TPH to define the edge of the release. All off-pad areas must meet OCD reclamation/revegetation standards. The variance to excavate the AOC up to 5 feet bgs and install liner is denied. The 400 ft2 confirmation sample size is denied. Due to the depth of potential excavation, please make sure extreme safety precautions are taken to ensure personnel safety.	12/19/2025
